**ABSTRACT**

*This articles describes the feasibility and reproducibility of the fact that citric acid is effective as a cancer treatment.*

**KEYWORDS :**

I published the medical hypothesis that citric acid, as being the natural inhibitor of glycolysis, would be effective as a cancer treatment since February, 2007, in the journal Medical Hypotheses, by Elsevier (1). Two years and three months later, on May, 2009, I published in the same journal the first case of a patient with cancer who improves only with citric acid as antineoplastic treatment, the patient is a 16 years old boy who had terminal cancer, medullary thyroid cancer as part of a multiple endocrine neoplasia (2). And 9 months later, on February, 2011, the second patient with terminal cancer, peritoneal mesothelioma, who improves again, only with citric acid, was published (3).

I have already published six more cases of cancer patients who have improved impressively only with the citric acid treatment that they have received, including patients with myeloid leukemia (4), Hürthle thyroid tumor (5), endocrine hepatic tumor (6), esophageal cancer (7), multiple myeloma (8) and glioblastoma multiforme (9).

The hypothesis that citric acid is effective as a cancer treatment has been demonstrated with these eight unquestionable cases (2-9): What would be missing for the acceptance of this fact in addition to scientific publications?

If this evidence is not reproducible, that citric acid is effective as a cancer treatment, the simplest step would be to publish an article against it, but that has not happened, yet.

But as I exposed in these articles (1-9) that the fact that citric acid is effective as a cancer treatment, and all patients with cancer tend to improve as these eight patients did (2-9), as is established in the Scientific Method, we are facing one of the most impacting dilemmas in the History of Medicine: The cure of cancer.

There are not conflicts of interest or financial disclosures.
