ABSTRACT

The nonsplit geodetic set  $S$  of a graph  $G=(V(G), E(G))$  is said to be total nonsplit geodetic set if the induced subgraph  $\langle S \rangle$  has no isolated vertices. The minimum cardinality of a total nonsplit geodetic set in  $G$  is called total nonsplit geodetic number of  $G$  and is denoted by  $g_{ns}(G)$ . In this paper we obtain a relationship between nonsplit geodetic number and the total nonsplit geodetic number of  $G$ . Also we find the total nonsplit geodetic number of some classes of graphs.

KEYWORDS

: Geodesic, geodetic set, geodetic number, nonsplit geodetic set, nonsplit geodetic number, total nonsplit geodetic number.

1. INTRODUCTION:

All graphs considered in these paper are finite, undirected, simple graphs. We denote the vertex set and the edge set of a graph  $G$  by  $V(G)$  and  $E(G)$  respectively. For a vertex  $v$  of  $G$ , the eccentricity  $e(v)$  is the distance between  $v$  and a vertex farthest from  $v$ . The minimum eccentricity among the vertices of  $G$  is the radius,  $rad G$ , and the maximum eccentricity is the diameter,  $dim G$ . A  $u-v$  path of length  $d(u,v)$  is also referred to as a  $u-v$  geodesic. We define  $I[u,v]$  to be the set of all vertices lying on some  $u-v$  geodesic of  $G$  and for a nonempty subset  $S$  of  $V(G)$ ,  $I[S]=\cup_{u,v \in S} I[u,v]$ . A set  $S$  of vertices of  $G$  is called a geodetic set in  $G$  if  $I[S]=V(G)$ . The geodetic number  $g(G)$  is the minimum cardinality of a geodetic set of  $G$ . A set of vertices  $S$  in a graph  $G$  is a nonsplit geodetic set if  $S$  is a geodetic set and the induced subgraph  $\langle V(G) - S \rangle$  is connected. The minimum cardinality of a nonsplit geodetic set, denoted  $g_{ns}(G)$  is called the nonsplit geodetic number of  $G$ . The nonsplit geodetic set  $S$  of a graph  $G$  is said to be total nonsplit geodetic set if the induced subgraph  $\langle S \rangle$  has no isolated vertices. The cardinality of a minimum total nonsplit geodetic set in  $G$  is called total nonsplit geodetic number of a graph and is denoted by  $g_{tns}(G)$ . We denote a path on  $n$  vertices and a cycle on  $n$  vertices by  $P_n$  and  $C_n$  respectively. A path on  $n$  vertices is a tree with two vertices of degree 1 and the other  $(n-2)$  vertices are of degree 2. A wheel graph  $W_n$  is a graph  $n$  vertices constructed by connecting a single vertex to every vertex in an  $(n-1)$  cycle. The  $(m, n)$ -tadpole graph also called a dragon graph is the graph obtained by joining a cycle graph  $C_m$  to a path graph  $P_n$  with a bridge. The Cartesian product  $G \times H$  of graphs  $G$  and  $H$  is a graph with the vertex set is the Cartesian product  $V(G) \times V(H)$  and two vertices  $(u, u')$  and  $(v, v')$  are adjacent in  $G \times H$  iff either  $u=v$  and  $u'$  is adjacent to  $v'$  in  $H$  or  $u=v'$  and  $u$  is adjacent to  $v$  in  $G$ . The  $n$ -ladder graph can be defined as  $P_2 \times P_n$ . It is therefore equivalent to the  $2 \times n$  grid graph. The  $n$ -book graph is defined as the Cartesian product  $S_{m+1} \times P_2$ , where  $S_m$  is a star graph. The fan graph  $F_{m,n}$  is defined as the graph join  $\bar{K}_m + P_n$  where  $\bar{K}_m$  is the empty graph on  $m$  nodes. A  $n$ -barbell graph is the simple graph obtained by connecting two copies of a complete graph  $K_n$  by a bridge. We use this idea to develop the concept of total nonsplit geodetic number.

2. Main Results:

**Definition 2.1:** The geodetic set  $S$  is said to be a total nonsplit geodetic set if the subgraph induced by  $S$  has no isolated vertices and the induced subgraph  $\langle V(G) - S \rangle$  is connected. The minimum cardinality of a total nonsplit geodetic set is called the total nonsplit geodetic number of  $G$  and is denoted by  $g_{tns}(G)$ .

For this graph  $G$ ,  $S=\{v_1, v_3, v_5, v_6\}$  is a total nonsplit geodetic set. Therefore  $g_{tns}(G)=4$ .

**Theorem 2.2.** For any path graph  $G$  of order  $n > 4$ ,  $g_{tns}(G)=4$ .

**Proof.** Let  $V(G) = \{v_1, v_2, \dots, v_{n-1}, v_n\}$  be the vertices of the path graph  $G$ . Let  $S = \{v_1, v_2, v_{n-1}, v_n\}$  be the total nonsplit geodetic set of  $G$  and  $I[S]=V(G)$ . The induced subgraph  $\langle S \rangle$  has no isolated vertices and the subgraph induced by  $\langle V(G) - S \rangle$  is connected. Therefore  $S$  is the minimum total nonsplit geodetic set of  $G$ . Hence  $g_{tns}(G)=4$ . ■

**Theorem 2.3.** For the cycle  $C_n$ ,  $n \geq 4$ ,  $g_{tns}(C_n) = \lfloor \frac{n}{2} - 1 \rfloor$

**Case(i):** When  $n$  is even

Consider  $\{v_1, v_2, \dots, v_{2n}, v_n\}$  be the cycle with  $2n$  vertices. Let  $S = \{v_1, v_2, \dots, v_{n-1}, v_n\}$  be a total nonsplit geodetic set of  $C_{2n}$ . For any two antipodal vertices  $v_1$  and  $v_i$  and  $\{v_2, \dots, v_{i-1}\}$  are the internal vertices of  $v_1 - v_i$ . Since no two vertices of  $S$  form a total nonsplit geodetic set, there exists a total nonsplit geodetic set contains  $\frac{n}{2} + 1$  vertices. Therefore  $I[S]=V(C_{2n})$ . Since  $v_1 - v_i$  is a path, the subgraph induced by  $S$  has no isolated vertices and the induced subgraph  $\langle V(G) - S \rangle$  is connected. Therefore  $S$  is the minimum total nonsplit geodetic set of  $C_{2n}$ . So  $g_{tns}(G)(C_{2n}) = |S| = \lfloor \frac{n}{2} + 1 \rfloor$

**Case(ii):** When  $n$  is odd.

Consider  $\{v_1, v_2, \dots, v_{2n+1}, v_1\}$  be a cycle with  $2n+1$  vertices. Let  $S = \{v_1, v_2, \dots, v_n, v_{n+1}\}$  be a total nonsplit geodetic set of  $C_{2n+1}$ . Then the paths,  $v_1 - v_{n+1}$  and  $v_1 - v_{n+1}$  includes all the vertices of  $C_{2n+1}$ ,  $|S| = \lfloor \frac{n}{2} + 1 \rfloor$ . Therefore  $I[S]=V(C_{2n+1})$ . The subgraph induced  $\langle S \rangle$  has no isolated vertices and the induced subgraph  $\langle V(G) - S \rangle$  is connected. Therefore  $S$  is the minimum total nonsplit geodetic set of  $C_{2n+1}$ ,  $g_{tns}(C_{2n+1}) = |S| = \lfloor \frac{n}{2} + 1 \rfloor$ . Hence  $g_{tns}(C_n) = \lfloor \frac{n}{2} + 1 \rfloor$

**Theorem 2.4.** For any wheel graph  $W_n$  of order  $n \geq 5$ ,  $g_{tns}(W_n) = n-2$ .

**Proof.** Let  $W_n = K_1 + C_{n-1}$  ( $n \geq 5$ ) with  $x$  be the vertex of  $K_1$  and  $V(C_{n-1}) = \{v_1, v_2, \dots, v_{n-1}\}$ . Let  $S = \{v_1, v_2, \dots, v_{n-2}\}$  be the total nonsplit geodetic set of  $W_n$ . Then any path  $v_i - v_j$ ,  $i, j = 1, (n-2)$  include all the vertices of  $W_n$ ,  $I[S]=V(W_n)$ . Since  $v_1 - v_{n-2}$  is a path the subgraph induced by  $S$  has no isolated vertices. The remaining vertices of  $W_n$  are  $v_{n-1}$  and  $x$  is connected. Thus  $S$  is the minimum total nonsplit geodetic set of  $W_n$ . Therefore  $g_{tns}(W_n) = |S| = n-2$ . ■

**Theorem 2.5.** For any tadpole graph  $G$  of order  $n \geq 1, m \geq 3$ ,

$$g_{tns}(G) = \begin{cases} g(G) + 1 & \text{if } m \text{ is odd} \\ g(G) + 2 & \text{if } m \text{ is even} \end{cases}$$

**Proof.** We prove this theorem by the following cases.

**Case (i):** When  $m$  is odd

Consider  $\{v_1, v_2, v_{m+n}\}$  be the vertices of  $G$ . Suppose  $S = \{v_1, v_2, v_{m+n}\}$  be the geodetic set of  $G$ . It is clear that  $\langle V(G) - S \rangle$  is connected. Thus  $S$  is a nonsplit geodetic set. But  $\langle S \rangle$  has isolated vertices,  $S$  not a total geodetic set. Let  $S' = S \cup \{v_{m+n-1}\}$ . Clearly  $\langle S' \rangle$  has no isolated vertices. Hence  $S'$  forms a minimal total nonsplit geodetic set. This follows that  $|S'| = |S| + 1$  implies that  $g_{tns}(G) = g(G) + 1$ .

**Case (ii):** When  $m$  is even.

Consider  $\{v_1, v_2, v_{m+n}\}$  be the vertices of a tadpole graph. Now consider  $S = \{v_1, v_{m+n}\}$  be the geodetic set of  $G$  and it is clear that  $\langle V(G) - S \rangle$  is connected. Thus  $S$  is a nonsplit geodetic set. But  $\langle S \rangle$  has an isolated vertices. Therefore consider  $S' = S \cup \{v_2, v_{m+n-1}\}$  such that  $\langle S' \rangle$  has no isolated vertices and  $\langle V(G) - S' \rangle$  is connected. Thus  $S'$  forms a minimum total nonsplit geodetic set. This follows that  $|S'| = |S| + 2$  implies that  $g_{tns}(G) = g(G) + 2$ . ■

**Theorem 2.6.** For any ladder graph  $G$  of order  $n \geq 3, g_{tns}(G) = g_{ns}(G)$ .

**Proof.** Let  $G$  be a ladder graph and let  $V(G) = \{v_1, v_2, \dots, v_{n-1}, v_n\}$ . In the ladder graph the geodetic set  $S = \{v_1, v_n\}$  is not a total nonsplit geodetic set because  $\langle S \rangle$  has isolated vertices. Therefore let us consider  $S' = \{v_1, v_2, \dots, v_{n-1}, v_n\}$ . Now all the vertices of  $G$  lies in the geodetic of vertices of  $S'$  and  $\langle V(G) - S' \rangle$  is connected. Thus  $S'$  forms a total nonsplit geodetic set. Implies  $g_{tns}(G) = |S'| = n = g(G) + g_{ns}(G)$ .

**Theorem 2.7.** Let  $G = Kn - e, n \geq 3$ . Then  $g_{tns}(G) = 3$ .

**Proof.** Let  $\{v_1, v_2, \dots, v_{n-1}, v_n\}$  be the vertices of  $G$ . Let  $S = \{v_1, v_n\}$  be such that  $\text{degree}(v_1) = \text{degree}(v_n) = n - 2$  and  $|S| = V(G)$ . Clearly  $S$  is a nonsplit geodetic set but the induced subgraph  $\langle S \rangle$  has isolated vertices. Therefore consider  $S' = S \cup \{v_i\}$ , where  $2 \leq i \leq n - 1$  such that  $\langle S' \rangle$  has no isolated vertices and  $\langle V(G) - S' \rangle$  is connected. Thus  $S'$  forms a minimum total nonsplit geodetic set. Therefore  $g_{tns}(G) = |S'| = 3$ . ■

**Theorem 2.8.** For any book graph  $G$  of order  $n \geq 2, g_{tns}(G) = r(G) + n$ .

**Proof.** Let  $\{v_1, v_2, \dots, v_{2n+2}\}$  be the set of all vertices of  $G$  and let  $S = \{v_1, v_2, v_{2n}, v_{2n+1}, v_{2n+2}\}$  be the geodetic set. Clearly  $|S| = n + 1$ . Then  $\langle V(G) - S \rangle$  is connected  $S$  is a nonsplit geodetic set. But  $\langle S \rangle$  has isolated vertices. Let  $S' = S \cup \{v_{2n+2}\}$ . Then  $\langle S' \rangle$  has no isolated vertices. Thus  $S'$  forms a minimum total nonsplit geodetic set. It follows that  $|S'| = n + 1 + 1 = n + 2$ . Implies  $g_{tns}(G) = n + 2$ . We have for any book graph,  $r(G) = 2$ . Therefore  $g_{tns}(G) = r(G) + n$ .

**Theorem 2.9.** For any fan graph  $G$  of order  $m \geq 1, n \geq 3, g_{tns}$

$$r(G) = \begin{cases} n & \text{if } m = 1 \\ m + 1 & \text{if } m \geq 2 \end{cases}$$

**Proof.** We prove this theorem by the following cases.

**Case (i):** When  $m = 1$

Consider  $\{v_1, v_2, \dots, v_{n+1}\}$  be the vertices of  $G$ . Now  $S = \{v_1, v_2, \dots, v_n\}$  be the nonsplit geodetic set. Clearly  $|S| = V(G)$ . But  $\langle S \rangle$  has an isolated vertices. So  $S' = S \cup \{v_{n+1}\}$ . Then  $\langle S' \rangle$  has no isolated vertices. Thus  $S'$  forms a total nonsplit geodetic set of  $G$  with minimum cardinality. Therefore  $g_{tns}(G) = \frac{n}{2} + \frac{n}{2} = n$ .

**Case (ii):** When  $m \geq 2$

Consider  $\{v_1, v_2, v_{m+n}\}$  be the vertices of  $G$ . Let  $S = \{v_1, v_2, \dots, v_{m+n-1}, v_{m+n}\}$  be the nonsplit geodetic set. Now consider induced subgraph  $\langle S \rangle$ .

Clearly  $\langle S \rangle$  has isolated vertices. Let  $S' = S \cup \{v_{m+n-1}\}$ . Thus  $S'$  forms a minimum total nonsplit geodetic set. Therefore  $g_{tns}(G) = |S'| = m + 1$ . ■

**Theorem 2.10.** For any graph of order  $n, g_{ns}(G) \leq g_{tns}(G)$ .

**Proof.** Let  $G$  be any graph with  $V(G) = \{v_1, v_2, \dots, v_n\}$ . Let  $S \subseteq V(G)$  be a nonsplit geodetic set of  $G$ . If the induced subgraph  $\langle S \rangle$  has no isolated vertices,  $S$  itself is a total nonsplit geodetic set and therefore  $g_{ns}(G) = g_{tns}(G)$ . Otherwise choose a minimal subset  $S' \subseteq V(G) - S$  such that induced subgraph  $\langle V(G) - (S \cup S') \rangle$  is connected and the induced subgraph  $\langle S \cup S' \rangle$  has no isolated vertices. Clearly  $S \cup S'$  is total nonsplit geodetic set of  $G$  and so  $g_{ns}(G) \leq g_{tns}(G)$ . Hence  $g_{ns}(G) \leq g_{tns}(G)$ .

**Theorem 2.11.** For a  $n$ -barbell graph  $G, g(G) = g_{ns}(G) = g_{tns}(G)$ .

**Proof.** Let  $G$  be a  $n$ -barbell graph. Obviously  $g(G) = g_{ns}(G) = g_{tns}(G) = 2(n - 1)$ .
