#### Abstract

Proton-ligand dissociation constants of carbocysteine ligand and the formation constants of their complexes with some transition metal ions ( $\mathrm{Cu} 2+, \mathrm{Ni} 2+, \mathrm{Co} 2+, \mathrm{Zn} 2+, \mathrm{Fe} 3+$ ) and some trivalent lanthanides ( $\mathrm{Ce}+3, \mathrm{Pr}+3$, $\mathrm{Er}+3$ ) ions have been determined potentiometrically in 0.1 M KNO3 in water. The effect of temperature was studied at 20, 30 and $40 \circ C$, the thermodynamic parameters ( $\Delta G 1, \Delta H 1, \Delta S 1$ ) were evaluated and discussed. The stoichiometry of the formed complexes in solution was determined spectrophotometrically. The obtained data reveals the formation of 1:2 (metal : ligand) complexes. The solid complexes derived from the transition metal ions with ligand under investigation were prepared in ammonia solution as $1: 2$ metal : ligand stoichiometry. The formed complexes were characterized by elemental analysis (C,H,N),IR, UV-Vis, X-ray and 1H-NMR spectroscopy. The water content of the formed complexes was determined by thermal analysis (TG, DTA). The biological activities of the synthesized complexes were tested on different types of bacteria and fungi. Copper(II) complexes gave the maximum activities while $\mathrm{Zn}(I)$ and $\mathrm{Ni}(\mathrm{II})$ gave the minimum results.

## Aim of the work:

The most accurate and reliable method for the determination of complex stability constants is the potentiometric measurement of hydrogen ion concentration. It could be achieved for any complex soluble in water or in mixed solvents. The dissociation constants of carbocysteine have been calculated at different temperatures and the associated thermodynamic parameters have been determined. The complexing ability of these compounds with some transition elements and lanthanide via, new, fast, simple, sensitive, precise and cheap procedures based on the potentiometric, spectrophotometric and cyclic voltammetric methods was studied. The present investigations, involve the synthesis, characterization and structure determination of the solid complexes of carbocysteine. Different tools as elemental analysis, electronic absorptions IR, UV-Vis, X-ray and ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectroscopy and thermal analysis (TG and DTA) have been carried out on some complexes. Antimicrobial activity of the synthesized compounds has been screened using non-pathogenic bacteria and fungi. The comparison between the biological activity of free ligand and its complexes were undertaken.

The aim of the present paper is to determine the dissociation constants of carbocysteine as pharmaceutical-ligand and its complexes with some transition elements and some trivalent lanthanides. The thermodynamic parameters of these complexes were evaluated at different temperatures. Our aim was also to characterize the formed complexes by elemental analysis (C, H and N), IR, UV-Vis, X-rays, thermal analysis and ${ }^{1}$ H-NMR spectroscopy. The biological effects of the formed complexes compared to the ligand were also investigated on different types of bacteria and fungi and confirmed better activities than cys alone.

## I. Introduction

The determination of carbocysteine (Cys) via formation of Pd(II) complex with (Cys) and its metabolites were studied ${ }^{1}$. Kinetic-potentiometric method for the determination of Cys
in coloured pharmaceuticals was described ${ }^{2}$. A kinetic-potentiometric method studied the formation of the complex between $\mathrm{PdCl}_{2}$ and Cys at $\mathrm{pH} 1.5-5$ using a stopped-flow technique was carried out ${ }^{3}$. Spectrophotometric estimation of amoxicillin and Cys in single dosage forms through the complexation with $\mathrm{Ni}(\mathrm{II})$ was reported ${ }^{4}$.

Spectrophotometric method was studied ${ }^{5}$ for determination (Cys) in pharmaceutical products. Orlovic et al. (2004) ${ }^{6}$ studied HPLC developed method for the determination of Cys in cough syrup preparations.

Carbocysteine (Cys)

## 2. Experimental

2.1. Chemicals

All the chemicals used were Analar grade Merck.

### 2.2. Apparatus

### 2.2.1. pH meter

pH -measurements were carried out using Fischer Scientific Accruement pH meter model 825 mp fitted with Fischer combined electrode and calibrated by a standard buffer solution at the desired temperature.

### 2.2.2.

UV/Vis spectrophotometer model spectronic 601 Milton Roy Company with 1 cm quartz cells had been used to obtain the ultraviolet and visible spectra of the investigated compounds at room temperature.

### 2.2.3.

Pye-Unicam SP2000 instrument (UK) had been used to obtain IR measurements in the rang 4000 to $500 \mathrm{~cm}^{-1}$

### 2.2.4.

CHN-Analyser model CHN Rapid, Fa. Heraeus (2400 P.E.) had been used to obtain the elemental analyses (C, H, N) for ligand and its complexes under investigation.

### 2.2.5.

Shimadzu DTA-TGA50 thermal analyzer, platinum cell, and in atmosphere of nitrogen had been used to obtain the thermal analysis of Cys-complexes.

### 2.2.6.

PW3710 BASED, tube anode cupper Generator tension [KV] 40 Generator current [mA]: 55, Divergence slit : 1.5, and Receiving slit : 0.1 has been used to obtain X-ray analysis of Cys-complexes.

### 2.2.7

Bank Eelktronic-intelligent controls GmbH Freiberger Strasse ID-38678 Clausthal-Zellerfeld was used to obtain the electroanalysis of ligands and complexes, the used cell consists of a silver-silver chloride ( $\mathrm{Ag} / \mathrm{Agcl}$ ) as a reference electrode, an auxiliary electrode of platinum wire and glassy carbon electrode as working electrode.

### 2.3. Preparation of solid complexes

The solid complexes were prepared by mixing equimolar of ligand and metal salts in ratio of $1: 2$ (metal : ligand), adding $3 \mathrm{ml}(30 \%) \mathrm{NH}_{4} \mathrm{OH}$. Stirring for 2 h , the separated solid complexes were filtered, washed with diluted $\mathrm{NH}_{4} \mathrm{OH}$ and dried at room temperature.

### 2.4. Antimicrobial activity

The antimicrobial activity of the synthesized complexes has been screened using different strains of nonpathogenic bacteria and fungi. The species were used Eschericherichia coli (gram negative bacteria), Bacillus subtilis (gram positive bacteria), Staphylococcus aureus, Condida albicans (yeast) and Pseudomonas aeruginosa. The disc method has been adopted and the diameters of clearing areas around wells (in mm) have been taken as indication to the antimicrobial activity.

### 2.5. Cyclic voltammetry

A 50 ml of test solution containing (1:2) (metal : ligand) ratio, and 3 ml of universal buffer $\mathrm{pH}=10.8$ were placed into the cell. The voltammogram was recorded by using cyclic voltammetry at different scan rate.

### 2.6. Methods of calculation

## a) pH -metric determination of the dissociation constants

The pH -meter reading $(B)$, recorded in aqueous medium and in methanol solutions were converted to hydrogen ion concentration $\left[\mathrm{H}^{+}\right]$, by means of the relation of Uitert and Hass ${ }^{7}$.
$\mathrm{pH}=-\log \left[\mathrm{H}^{+}\right]=\mathrm{B}+\log \mathrm{U}_{\mathrm{H}}$
where $\log U_{H}$ is the correction factor for the effects of solvent composition.
b- Determination of stability constant of metal complexes
$n^{-} /(n-1)[L]=((2-n)[L] / n-1) \beta_{2}-\beta_{1}$
Where
$\mathrm{n}=$ the average proton number in ligand
$n^{-}=$an integer that has value $1,2,3, N$.
$\beta_{1}=$ the formation constant $=K_{1}$
$\beta_{2}=K_{1} K_{2}$
c- Determination of the thermodynamic functions ${ }^{8-12}$

Gibb's free energy changes $(\Delta G)$, enthalpy changes $(\Delta H)$ and entropy ( $\Delta \mathrm{S}$ ):
$\Delta \mathrm{G}=-2.303 \mathrm{RT} \log \mathrm{K}$
$\Delta H=-\left(2.303 R T, T_{2} /\left(T_{2}-T_{1}\right) \times\left(\log K_{T_{1}}-\log K_{T_{2}}\right)\right.$
$\Delta \mathrm{S}=(\Delta \mathrm{H}-\Delta \mathrm{G}) / \mathrm{T}$

Where:
$R$ : gas constant $=8.3 \mathrm{JK}^{-1} \mathrm{~mol}^{-1}$
K : Stability constant for the complex or the ionization constant of the ligand.

T : temperature ( K )
$\mathrm{K}_{\mathrm{T}}$ and $\mathrm{K}_{\mathrm{T}}$ are the ionization constants of the ligand or stability consfants of the complexes at temperatures $\mathrm{T}_{1}$ and $\mathrm{T}_{2}$.

## 3- Results and Discussion

3.1. Potentiometric studies of proton-ligand stability constants of carbocysteine (Cys)

The $\mathrm{pK}_{\mathrm{a}}$ values were determined using the linear least-square computer program ${ }^{13}$.

### 3.1.1. Effect of temperature

The effect of temperature on the ionization constants of Cys is shown in Fig. (1).

Fig.(1) Effect of temperature on ionization constant of Cys, $\mathrm{C}_{\text {кNО }}^{3} \mathrm{=}=0.1 \mathrm{M}, \mathrm{C}_{\text {кон }}=0.017 \mathrm{M}$ and $\mathrm{C}_{\mathrm{Cys}}=0.003 \mathrm{M}$

It is clear that $\mathrm{pK}_{1}$ and $\mathrm{pK}_{2}$ values increase with the increase of temperature from $20^{\circ}$ to $40^{\circ} \mathrm{C}$. This may be due to the fast deprotonation processes at high temperatures.

### 3.1.3. Ionization constants and thermodynamic functions

The values of $\Delta \mathrm{H}^{\circ}$ shown in Table (1) indicate that the endothermic ionization nature process, which is enhanced with the increase of temperature. In addition to the positive values of $\Delta \mathrm{H}^{\circ}$, and the positive values of $\Delta \mathrm{G}^{\circ}$ make the ionization process nonspontaneous. At $\mathrm{pK} \mathrm{a}_{\mathrm{a}}$ the values of $\Delta \mathrm{S}^{\circ}$ are negative while at $\mathrm{pK}_{\mathrm{a}_{2}}$ it is positive, conffirming that $\mathrm{pK}_{\mathrm{a}_{2}}$ is entropically favorable. ${ }_{2}$

Table (1). Thermodynamic functions for the dissociation constants of Cys in aqueous medium, $\mathrm{C}_{\mathrm{kNO}}^{3} \mathrm{~F}=0.1 \mathrm{M}$ and at different temperatures.

| Temp. <br> K | Dissociation constants |  | Enthalpy change$\Delta H^{\circ}$ |  | Free energy change$\Delta \mathrm{G}^{\circ}$ |  | Entropy $\Delta S^{\circ}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | pK, | $\mathrm{pK}_{\mathrm{a}}$, |  |  |  |  |  |
| 293 | 4.3635 | 9.4216 | 2.12899 | 9.9380 | 2.5316 | 5.48569 | -1.3744-5.1955 |
| 303 | 4.3106 | 9.177 | 2.1289 | 9.9380 | 2.59549 | 5.52564 | -1.5391-14.562 |
| 313 | 4.2056 | 9.1447 | 2.12899 | 9.9380 | 2.6158 | 5.6879 | -1.555-13.578 |

$\Delta \mathrm{G}^{\circ}$ units are (kcal.mol ${ }^{-1}$ )
$\Delta H^{\circ}$ units are (kcal.mol ${ }^{-1}$ )
$\Delta \mathrm{S}^{\circ}$ units are (cal. $\mathrm{mol}^{-1} . \mathrm{K}^{-1}$ )

### 3.2. Complexes of transition metals

During the titration of the ligand under investigation there was only one inflection point indicating that the ligand behaves as a diprotonic acid. The ligand-metal mixtures $\left(\mathrm{Zn}^{2+}, \mathrm{Ni}^{2+}, \mathrm{Co}^{2+}, \mathrm{Cu}^{2+}\right.$ and $\left.\mathrm{Fe}^{3+}\right)$, were titrated at 20, 30 and $40^{\circ} \mathrm{C}$ (ionic strength $0.1 \mathrm{M} \mathrm{KNO}_{3}$ and $\mathrm{C}_{\text {Кон }}=0.017 \mathrm{M}$ ) in aqueous medium. The formation of a clear homogeneous solution when base is added to a solution of the metal ion and a possible ligand is an indication that a metal chelate compound (or complex) has been formed ${ }^{14}$.

Figs. ( $2 a, b, \& c$ ) show the effect of temperatures on the titration curves of Cys-complexes. The values of the stability constants $\log \mathrm{K}_{1}$ and $\log \mathrm{K}_{2}$ of the complexes formed at different temperatures are shown in Table (2).

Fig. (2a). pH -titration curves of Cys and its complexes at $\mathrm{T}=20^{\circ} \mathrm{C}$ and ratio of (metal-ligand) $=1: 2$

Fig.(2b). pH - titration curves of Cys and its complexes at $\mathrm{T}=30^{\circ} \mathrm{C}$ and ratio of (metal-ligand) $=1: 2$

Fig.(2c). pH -titration curves of Cys and its complexes at $\mathrm{T}=40^{\circ} \mathrm{C}$ and ratio of metal-ligand) $=1: 2$

Table (2). Stepwise stability constants for the complexation of Cys with $\mathrm{Zn}^{2+}, \mathrm{Ni}^{2+}, \mathrm{Co}^{2+}, \mathrm{Cu}^{2+}$ and $\mathrm{Fe}^{3+}$ in aqueous medium and $0.1 \mathrm{M} \mathrm{KNO}_{3}$ at different temperatures.

| $\mathrm{M}^{\mathrm{n+}}$ | 293 K |  | 303 K |  | 313 K |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Log K 1 | Log K | Log K ${ }_{1}$ | Log K, | Log K, | Log K, |
| $\mathrm{Zn}^{2+}$ | 12.46 | 12.15 | 12.79 | 12.41 | 13.277 | 12.79 |
| $\mathrm{Co}^{2+}$ | 12.61 | 12.27 | 12.88 | 12.523 | 13.39 | 12.81 |
| $\mathrm{Ni}^{2+}$ | 12.525 | 12.39 | 13.277 | 12.623 | 13.44 | 12.89 |
| $\mathrm{Cu}^{2+}$ | 12.883 | 12.07 | 13.64 | 12.89 | 13.87 | 13.81 |
| $\mathrm{Fe}^{3+}$ | 14.587 | 13.354 | 14.68 | 13.72 | 14.75 | 13.83 |

The values of the stability constants of $\mathrm{Zn}^{2+}$ are relative small compared with those of $\mathrm{Cu}^{2+}$ and $\mathrm{Fe}^{2+}$ where the d-orbital of $\mathrm{Zn}^{2+}$ is completely filled. Therefore these metals form more stable complexes than $\mathrm{Zn}^{2+}$. The stability of the complexes decreases in the following order:
$\mathrm{Fe}^{3+}>\mathrm{Cu}^{2+}>\mathrm{Ni}^{2+}>\mathrm{Co}^{2+}>\mathrm{Zn}^{2+}$

## Thermodynamic functions

Thermodynamic parameters $\Delta G^{\circ}, \Delta H^{\circ}$ and $\Delta S^{\circ}$ for the complex compounds were calculated from the stability constants obtained at various temperature ( 20,30 and $40^{\circ} \mathrm{C}$ ). The values of the thermodynamic parameters associated with complex formation are indicated in Table 3. The stepwise stability constants of the complexes increase with increasing the temperature. The positive value of $\Delta \mathrm{G}^{\circ}$ for complexation process suggests the nonspontaneous nature and the negative value of $\Delta \mathrm{H}^{\circ}$ meaning that these processes are exothermic and clearly reflect the increasing metal-ligand strength ${ }^{15}$.

Table (3). Thermodynamic functions of Cys with $\mathbf{Z n}^{2+}, \mathbf{N i}^{2+}$, $\mathrm{Co}^{2+}, \mathrm{Cu}^{2+}$ and $\mathrm{Fe}^{3+}$ in aqueous medium and $0.1 \mathrm{M}_{K_{N O}}$.

### 3.3. Complexes of lanthanides with ligand

### 3.3.1. pH-metric study

The lanthanide ions $\left(\mathrm{Ce}^{3+}, \mathrm{Pr}^{3+}\right.$ and $\left.\mathrm{Er}^{3+}\right)$ with $[\mathrm{Cys}]=0.003 \mathrm{M}$ ligand were titrated against $\mathrm{KOH}, 0.017 \mathrm{M}$ at $(20,30$ and $40^{\circ} \mathrm{C}$ ) and ionic strength of $0.1 \mathrm{M}_{\mathrm{KNO}_{3}}$ in aqueous medium. The pH -reading decreased comparing with that of the titration curve of the free ligand.

Figs. (3a, b \& c) show the effect of temperatures on the titration curves of Cys-complexes. The values of the stability constants $\log \mathrm{K}_{1}$ of the complexes formed at different temperatures are shown in Table (4), the stability of the complexes shows the following order:
$\mathrm{Er}^{3+}>\mathrm{Pr}^{3+}>\mathrm{Ce}^{3+}$

Fig. (3a). pH titration curves of Cys and its complexes at

Fig.(3b). pH - titration curves of Cys and its complexes at $\mathrm{T}=30^{\circ} \mathrm{C}$ and ratio of (metal- ligand) $=1: 2$

$\Delta \mathrm{S}^{\circ}$ units are (cal. $\mathrm{mol}^{-1} . \mathrm{K}^{-1}$ )

### 3.4. Spectrophotometric studies

## Spectrophotometric studies of Cys-complexes

The study on the complexes of $\mathrm{Ni}^{2+}, \mathrm{Co}^{2+}$ and $\mathrm{Cu}^{2+}$ with Cys comprises the following:

1) Spectrophotometric studies gave well-defined peaks for the complexes of $\mathrm{Ni}^{2+}, \mathrm{Co}^{2+}$ and $\mathrm{Cu}^{2+}$ with Cys.
2) The molar ratio method confirm that Cys formed complexes with $\mathrm{Ni}^{2+}, \mathrm{Co}^{2+}$ and $\mathrm{Cu}^{2+}$ in a molar ratio of (1:1) and (1:2), (metal : ligand) which agree with potentiometric studies.

### 3.5. Cyclic voltammetry

Adsorption study of processes for Cys-complexes

### 3.5.1. Effect of the scan rate

For both Cys- Cu (II) and Cys-Co(II) complexes at different scan rate a well defined peaks were observed on the cathodic branch. This indicates that the oxidation of $\mathrm{Cys}-\mathrm{Cu}(I I)$ and Cys-Co(II) complexes is irreversible (Figs. 4, 5).The peak current increase with the increase of the scan rate that indicating diffusion-controlled nature of $\mathrm{Cys}-\mathrm{Cu}(\mathrm{II})$ and $\mathrm{Cys}-\mathrm{Co}(\mathrm{II})$ complexes.

Fig.(4). Cyclic voltammograms for $\mathrm{Cys}-\mathrm{Cu}(\mathrm{II})$ complex at different scan rate $\mathrm{pH}=10.8$ (metal:ligand) $=1: 2$.

Fig.(5). Cyclic voltamograms for Cys-Co(II) complex at different scan rate, $($ metal:ligand $)=1: 2$ and $\mathrm{pH}=8.6$

### 3.5.2. Study of reaction mechanisms

One of the most important application of Cyclic voltammetry is for quantitative diagnosis of chemical reactions that proceed or succeed the redox process ${ }^{16}$.

### 3.6. Solid complexes

### 3.6.1. Infrared spectra

The elemental analysis of the solid complexes shows 1:2 metal to ligand stoichiometry. The I.R spectra of solid complexes have been measured in the range, $4000-500 \mathrm{~cm}^{-1}$. The interested spectral data of the complexes in different regions are shown in table (6).

In all the complexes studied a broad band appeared around (3565-3323) $\mathrm{cm}^{-1}$ attributable to water molecule ${ }^{17}$. The values of the stretching vibration frequencies of the two carbonyl groups of Cys are $(1687.3,1632) \mathrm{cm}^{-1}$ and the two bands are disapppeared completely in case $\mathrm{Cu}^{2+}, \mathrm{Co}^{2+}, \mathrm{Ni}^{2+}$ and $\mathrm{Fe}^{3+}$ complexes, indicating for only oxygen coordination case ${ }^{18}$, they play the role of chelation sites and ( $\mathrm{Zn}^{2+}-\mathrm{Cys}$ ) complex shows a negative shift of $\mathrm{vC}=\mathrm{O}$ at $1638.3 \mathrm{~cm}^{-1}$ for the first carbonyl while the second carbonyl group is disappeared. This indicates that the two carbonyl groups play the role of chelation sites on complexation ${ }^{19}$. Two new bands appeared in the spectrum of each complex at (780.9-489.1) $\mathrm{cm}^{-1}$ and (707.5-428) $\mathrm{cm}^{-1}$ which may be assigned to $v \mathrm{M}=$ $\mathrm{O}_{1}$ and $v \mathrm{M}=\mathrm{O}_{2}$ respectively.

Table (6). IR studies of Cys and its metal complexes.

| Complexes | $v \mathrm{H}_{2} \mathrm{O}$ | $v \mathrm{~N}-\mathrm{H}$ | $\stackrel{.}{ } \mathrm{C}=\mathrm{O}_{1}$ | $v \mathrm{C}=\mathrm{O}_{2}$ | $v \mathrm{M}-\mathrm{O}_{1}$ | $v \mathrm{M}-\mathrm{M}_{2}$ |

| $\left[\mathrm{Fe} . \mathrm{L}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right] \cdot \mathrm{H}_{2} \mathrm{O}$ | $\begin{aligned} & 3412.1 \\ & (b) \end{aligned}$ | $\begin{aligned} & 3197.2 \\ & (\mathrm{~b}) \end{aligned}$ | -- | -- | 693.3 | 575.8 |

### 3.6.2. Thermal analysis

The thermal gravimetric curves of $\mathrm{Cu}^{2+}$ and $\mathrm{Fe}^{3+}$ complexes exhibited well-defined endothermic peaks at (6751-162.20) and (53.96-174.79) as shown by ATG differential curve, the weight loss are $12.56 \%, 25.321 \%$ and $4.66 \%, 9.62 \%$ respectively, indicating that the presence of two molecules of water in the coordination form and one molecule of water of crystallization in the sphere of these complexes ${ }^{20}$. On the other hand, the other metal complexes studied exhibit one endothermic peak at temperatures around 60 and $100^{\circ} \mathrm{C}$ for $\mathrm{Ni}^{2+}$-Cys and $\mathrm{Co}^{2+}$-Cys complexes respectively as shown by ATG differential curve, the weight loss are $9.651 \%$ and $13.82 \%$ respectively, indicating that one molecule of water crystallization in the outer sphere of these complexes. The relevant data is shown in table (7).

Table (7). The thermo-gravimetric studies of the Cys-complexes.

| Metal complexes | Wt\% loss | Endo-peaks | Exo-peaks |
| :--- | :--- | :--- | :--- |
| $\left[\mathrm{Cu} . \mathrm{L}_{2} \cdot\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right] \mathrm{H}_{2} \mathrm{O}$ | $12.565-$ <br> 25.321 | $67.51-162.2$ | -- |
| $\left[\mathrm{Fe} . \mathrm{L}_{2} \cdot\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right] \mathrm{H}_{2} \mathrm{O}$ | $4.66-9.62$ | $53.961-74.79$ | -- |
| $\left[\mathrm{Ni.L} \mathrm{~L}_{2} \mathrm{H}_{2} \mathrm{O}\right.$ | 9.651 | 71.22 | -- |
| $\left[\mathrm{Co} . \mathrm{L}_{2}\right] \mathrm{H}_{2} \mathrm{O}$ | 13.828 | 77.05 | -- |

### 3.6.3. Elemental analysis

Elemental analysis and other physical states of Cys and its metal complexes is shown in table (8).

Table (8).

| Elemental analysis |  |  |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $[$ M.Ln $) \mathrm{HH}_{2} \mathrm{O}$ | M.W | $\mathrm{N} \%$ |  | H\% |  | C\% |  | M.P. | Color |
|  |  | C | F | C | F | C | F |  |  |
| Cys | 179.2 | 7.77 | 7.8 | 5.05 | 5.06 | 33.3 | 33.5 | 206 | White |
| $\left[\mathrm{Zn} . \mathrm{L}_{2}\right] \mathrm{H}_{2} \mathrm{O}$ | 430.4 | 5.17 | 5.22 | 4.08 | 4.11 | 27.4 | 27.28 | 260 | White |
| $\left[\mathrm{Cu} . \mathrm{L}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right] \mathrm{H}_{2} \mathrm{O}$ | 473.5 | 1.38 | 1.33 | 5.53 | 5.51 | 23.2 | 23.1 | Over-300 | Blue |
| Fe. $\mathrm{L}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2} \mathrm{H}_{2} \mathrm{O}$ | 465.9 | 3.1 | 3.5 | 3.77 | 3.76 | 26.06 | 25.91 | Over-300 | Brown |
| pCo. $\mathrm{L}_{2} \mathrm{H}_{2} \mathrm{O}$ | 432.9 | 4.13 | 4.14 | 3.73 | 3.74 | 27.58 | 27.98 | Over-300 | Red-dark |
| $\left[\right.$ Ni. $\mathrm{L}_{2} \mathrm{H}_{2} \mathrm{O}$ | 432.7 | 4.12 | 4.14 | 4.08 | 4.11 | 27.6 | 27.88 | 270 | Green |

### 3.6.4. X-ray diffraction

## X-ray analysis of Cys-complexes

X-ray analysis for $\mathrm{Cu}(\mathrm{II})$-Cys complex, Zn (II)-Cys complex Ni(II)-Cys complex and Co(II)-Cys complex were carried out by using PW 3710 BASED diffractometer type, tube anode cupper, and PC-APD, diffraction software indicates that $\mathrm{Cu}(\mathrm{II})$-Cys complex and Zn (II)-Cys complexes formed crystalline structure, but Ni(II)-Cys and Co (II)-Cys complexes formed amorphous structure.

### 3.7. Antimicrobial activity

Table (9) shows the metal complexes of the studied (Cys) ligand with the cations; $\mathrm{Zn}^{2+}, \mathrm{Cu}^{2+}$ and $\mathrm{Ni}^{2+}$ enhanced dramatically the antimicrobial properties by comparison with their ligand. This effect is due to the fact that cations, $\mathrm{Zn}^{2+}, \mathrm{Cu}^{2+}$ and $\mathrm{Ni}^{2+}$ form active compounds which have killing effect on two bacterial isolates (Bacillus subtilns and Staph. aureus) while the other cations ( $\mathrm{Fe}^{3+}$ and $\mathrm{Co}^{2+}$ ) had no effect on the tested microorganisms.

Table (9). The antimicrobial activity of the compounds synthesized.

| Compounds | Bacterial isolates | Activity | MIC |
| :---: | :---: | :---: | :---: |
| Zn ${ }^{2+}$ | Staph. aureus Bacillus subtilus Candida albicans Pseudomonas | $\begin{aligned} & +++ \\ & + \\ & - \\ & - \end{aligned}$ | $\begin{aligned} & 0.000246 \\ & 0.000492 \end{aligned}$ |
| $\mathrm{Cu}^{2+}$ | Staph.aureus Bacillus subtilus Candida albicans Pseudonas | $\begin{aligned} & ++ \\ & +++ \end{aligned}$ | $\begin{aligned} & 0.000135 \\ & 0.000135 \end{aligned}$ |
| $\mathrm{Ni}^{2+}$ | Staph.aureus Bacillus subtilus Candida albicans Pseudonas | $\begin{aligned} & +++ \\ & + \\ & - \\ & - \\ & \hline \end{aligned}$ | $\begin{aligned} & 0.000256 \\ & 0.000513 \end{aligned}$ |
| $\mathrm{Co}^{2+}, \mathrm{Fe}^{3+}$ | Staph.aureus Bacillus subtilus Candida albicans Pseudonas |  | --- |
| Cys | Staph.aureus Bacillus subtilus Candida albicans Pseudonas |  | --- |
