**ABSTRACT** In this paper, we introduce and study the properties of wgr $\alpha$ -I-closed sets in ideal topological spaces. Their relationships with other existing generalized closed sets in topological and ideal topological spaces are established.

### 1. Introduction

In 1990, Jankovic and Hamlett investigated the applications of topological ideals[5].In 1999,Dontchev et al. studied the notion of generalized closed sets in ideal topological spaces called  $I_g$ -closed sets [3]. Navaneethkrishnan and joseph [10] further investigated and characterized  $I_g$ -closed sets and  $I_g$ -open sets by the use of local functions. In this paper, we define and characterize wgr $\alpha$ -I-closed sets and wgr $\alpha$ -I-open sets.

### 2. Preliminaries

An ideal  $I$  on a topological space  $(X, \tau)$  is non-empty collection of subsets of  $X$  which satisfies the following properties. (1)  $A \in I$  and  $B \subseteq A$  implies  $B \in I$ , (2)  $A \in I$  and  $B \in I$  implies  $A \cup B \in I$ . An ideal topological spaces is a topological space  $(X, \tau)$  with an ideal  $I$  on  $X$  and is denoted by  $(X, \tau, I)$ . For a subset  $A \subseteq X, A^*(I, \tau) = \{x \in X : A \cap U \notin I \text{ for every } U \in \tau(X, x)\}$  is called the local function of  $A$  with respect to  $I$  and  $\tau$  [7]. We simply write  $A^*$  in case there is no chance for confusion. A kuratowski closure operator  $cl^*(I, \tau)$  called the  $*$ -topology, finer than  $\tau$  is defined by  $cl^*(A) = A \cup A^*$  [14]. If  $A \subseteq X$ ,  $cl(A)$ ,  $int(A)$  will respectively, denote the closure and interior of  $A$  in  $(X, \tau)$ .

#### Definition 2.1.

A subset  $A$  of a space  $(X, \tau)$  is called

1. regular open [13] if  $A = int(cl(A))$ .
2. regular  $\alpha$ -open [13] if there is a regular open set  $U$  such that  $U \subseteq A \subseteq \alpha cl(U)$ .
3.  $\alpha$ -open[4] if  $A \subseteq int(cl(int(A)))$ .
4. semi-open[13] if  $A \subseteq cl(int(A))$ .

#### Definition: 2.2

A subset  $A$  of  $(X, \tau)$  is said to be

1.  $g$ -closed [9], if  $cl(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
2. wgr $\alpha$ -closed[6], if  $cl(int(A)) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is regular  $\alpha$ -open in  $(X, \tau)$ .
3.  $\omega$ -closed[13], if  $cl(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is semi-open in  $(X, \tau)$ .
4. rga-closed[13], if  $\alpha cl(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is regular  $\alpha$ -open in  $(X, \tau)$ .
5. swg-closed[2], if  $cl(int(A)) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is semi-open in  $(X, \tau)$ .

#### Definition: 2.3

A subset  $A$  of  $(X, \tau, I)$  is said to be

1.  $\alpha$ -I-closed [1], if  $cl(int^*(cl(A))) \subseteq A$ .
2.  $I_g$ -closed [11], if  $A^* \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is regular-open in  $(X, \tau)$ .
3.  $I_\alpha$ -closed [8], if  $A^* \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is  $\hat{\omega}$ -open in  $(X, \tau)$ .
4.  $*$ -closed[5], if  $A^* \subseteq A$ .
5. I-open[5], if  $A \subseteq int(A^*)$ .
6. I-R closed[1], if  $A = cl^*(int(A))$ .
7. rps-I-closed[12], if  $spIcl(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is a rg-I-open in  $(X, \tau)$ .

### 3. wgr $\alpha$ -I-closed sets.

#### Definition: 3.1

A subset  $A$  of an ideal space  $(X, \tau, I)$  is said to be wgr $\alpha$ -I-closed if  $cl^*(int(A)) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is regular  $\alpha$ -open.

#### Definition: 3.2

A subset  $A$  of an ideal space  $(X, \tau, I)$  is said to be wgr $\alpha$ -I-open if  $X - A$  is wgr $\alpha$ -I-closed.

#### Theorem: 3.3

1. Every closed set is wgr $\alpha$ -I-closed.
2. Every  $\alpha$ -closed set is wgr $\alpha$ -I-closed.

3. Every  $\omega$ -closed set is  $wgr\alpha$ -I-closed.
4. Every  $rg\alpha$ -closed set is  $wgr\alpha$ -I-closed.
5. Every  $swg$ -closed set is  $wgr\alpha$ -I-closed.
6. Every  $wgr\alpha$ -closed set is  $wgr\alpha$ -I-closed.
7. Every  $\tau^*$ -closed set is  $wgr\alpha$ -I-closed.
8. Every  $\alpha$ -I-closed set is  $wgr\alpha$ -I-closed.

**Proof**

Straight forward.

**Remark: 3.4**

Converse of the above theorem need not be true as shown in the following examples.

**Example: 3.5**

Let  $X = \{a, b, c, d\}, \tau = \{\emptyset, X, \{a\}, \{b\}, \{a, b\}, \{b, c\}, \{a, b, c\}\}, I = \{\emptyset, \{a\}\},$  then  $\tau^c = \{\emptyset, X, \{d\}, \{a, d\}, \{c, d\}, \{a, c, d\}, \{b, c, d\}, \tau^*\text{-open} = \{\emptyset, X, \{a\}, \{b\}, \{a, b\}, \{b, c\}, \{a, b, c\}, \{b, c, d\}\}$  and  $\tau^*\text{-closed} = \{\emptyset, X, \{a\}, \{d\}, \{a, d\}, \{c, d\}, \{b, c, d\}, \{a, c, d\}\}.$   $wgr\alpha$ -I-closed =  $\{\emptyset, X, \{a\}, \{c\}, \{d\}, \{a, b\}, \{a, c\}, \{a, d\}, \{b, d\}, \{c, d\}, \{a, b, c\}, \{a, b, d\}, \{a, c, d\}, \{b, c, d\}\}.$

- (i).  $\{a\}$  is  $wgr\alpha$ -I-closed, but not closed.
- (ii).  $\{a, b\}$  is  $wgr\alpha$ -I-closed, but not  $\alpha$ -closed.
- (iii).  $\{c\}$  is  $wgr\alpha$ -I-closed, but not  $\omega$ -closed.
- (iv).  $\{a\}$  is  $wgr\alpha$ -I-closed, but not  $rg\alpha$ -closed.
- (v).  $\{a, c\}$  is  $wgr\alpha$ -I-closed, but not  $swg$ -closed.
- (vi).  $\{a\}$  is  $wgr\alpha$ -I-closed, but not  $wgr\alpha$ -closed.
- (vii).  $\{b, d\}$  is  $wgr\alpha$ -I-closed, but not  $\tau^*$ -closed.

**Example: 3.6**

Let  $X = \{a, b, c, d\}, \tau = \{\emptyset, X, \{a\}, \{c, d\}, \{a, c, d\}\}, \tau^c = \{\emptyset, X, \{b\}, \{a, b\}, \{b, c, d\}\}, I = \{\emptyset, \{a\}\},$   
 $\tau^*\text{-open} = \{\emptyset, X, \{a\}, \{c, d\}, \{a, c, d\}, \{b, c, d\}\}, \tau^*\text{-closed} = \{\emptyset, X, \{a\}, \{b\}, \{a, b\}, \{b, c, d\}\}$  and  
 $wgr\alpha$ -I-closed =  $\{\emptyset, X, \{a\}, \{b\}, \{c\}, \{d\}, \{a, b\}, \{a, c\}, \{a, d\}, \{b, c\}, \{b, d\}, \{a, b, c\}, \{a, b, d\}, \{a, c, d\}, \{b, c, d\}\}.$  Here  $\{a, b, c\}$  is  $wgr\alpha$ -I-closed, but not  $\alpha$ -I-closed.

**Remark:3.7**

The concepts semi-closed,  $I_\omega$  closed,  $rps$ -I-closed and  $wgr\alpha$ -I-closed are independent.

**Example: 3.8**

Let  $X = \{a, b, c, d\}, \tau = \{\emptyset, X, \{a\}, \{b\}, \{a, b\}, \{b, c\}, \{a, b, c\}\}, I = \{\emptyset, \{a\}\},$  then  $\tau^c = \{\emptyset, X, \{d\}, \{a, d\}, \{c, d\}, \{a, c, d\}, \{b, c, d\}, \tau^*\text{-open} = \{\emptyset, X, \{a\}, \{b\}, \{a, b\}, \{b, c\}, \{a, b, c\}, \{b, c, d\}\}$  and  
 $\tau^*\text{-closed} = \{\emptyset, X, \{a\}, \{d\}, \{a, d\}, \{c, d\}, \{b, c, d\}, \{a, c, d\}\}.$   $wgr\alpha$ -I-closed =  $\{\emptyset, X, \{a\}, \{c\}, \{d\}, \{a, b\}, \{a, c\}, \{a, d\}, \{b, d\}, \{c, d\}, \{a, b, c\}, \{a, b, d\}, \{a, c, d\}, \{b, c, d\}\}.$

- (i).  $\{b\}$  is semi-closed, but not  $wgr\alpha$ -I-closed.  $\{a, b\}$  is  $wgr\alpha$ -I-closed, but not semi-closed.
- (ii).  $\{b, c\}$  is  $I_\omega$ -closed, but not  $wgr\alpha$ -I-closed.  $\{c\}$  is  $wgr\alpha$ -I-closed, but not  $I_\omega$ -closed.
- (iii).  $\{b, c\}$  is  $rps$ -I-closed, but not  $wgr\alpha$ -I-closed.  $\{a, b, c\}$  is  $wgr\alpha$ -I-closed, but not  $rps$ -I-closed.

**Remark:3.9**

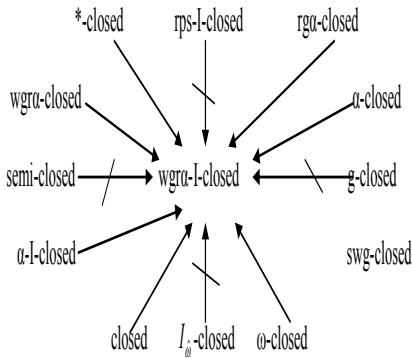

The concepts  $wgr\alpha$ -I-closed and  $g$ -closed are independent of each other.

**Example:3.10**

Let  $X = \{a, b, c, d\}, \tau = \{\emptyset, X, \{a\}, \{c, d\}, \{a, c, d\}\}, \tau^c = \{\emptyset, X, \{b\}, \{a, b\}, \{b, c, d\}\}, I = \{\emptyset, \{a\}\}, \tau^*\text{-open} = \{\emptyset, X, \{a\}, \{c, d\}, \{a, c, d\}, \{b, c, d\}\}, \tau^*\text{-closed} = \{\emptyset, X, \{a\}, \{b\}, \{a, b\}, \{b, c, d\}\}$  and  $wgr\alpha$ -I-closed =  $\{\emptyset, X, \{a\}, \{b\}, \{c\}, \{d\}, \{a, b\}, \{a, c\}, \{a, d\}, \{b, c\}, \{b, d\}, \{a, b, c\}, \{a, b, d\}, \{a, c, d\}, \{b, c, d\}\}.$   $\{a\}$  is  $wgr\alpha$ -I-closed, but not  $g$ -closed.  $\{c, d\}$  is  $g$ -closed, but not  $wgr\alpha$ -I-closed.

**Remark:3.11**

From theorem:3.3, remark :3.7 and remark:3.9, following diagram holds.

**Remark:3.12**

Union of two wgru-I-closed set is not wgru-I-closed.

**Example:3.13**

Let  $X = \{a, b, c, d\}, \tau = \{\emptyset, X, \{a\}, \{c, d\}, \{a, c, d\}\}$  and  $I = \{\emptyset, \{a\}, \{c\}$  and  $\{d\}$  are wgru-I-closed, but  $\{c, d\}$  is not wgru-I-closed.

**Remark:3.14**

Intersection of two wgru-I-closed set is not wgru-I-closed.

**Example:3.15**

Let  $X = \{a, b, c, d\}, \tau = \{\emptyset, X, \{a\}, \{b\}, \{a, b\}, \{b, c\}, \{a, b, c\}\}$  and  $I = \{\emptyset, \{a\}, \{a, b\}$  and  $\{b, d\}$  are wgru-I-closed, but  $\{b\}$  is not wgru-I-closed.

**Theorem: 3.16**

Let  $(X, \tau, I)$  be an ideal space and  $A \subseteq X$ . If  $A$  is wgru-I-closed, then  $cl^*(int(A)) - A$  contains no non-empty regular  $\alpha$ -open set.

**Proof**

Let  $A$  be a wgru-I-closed set in  $X$  and  $U$  be a regular- $\alpha$ -open subset of  $cl^*(int(A)) - A$ . Then  $A \subseteq X - U$  and  $X - U$  is regular  $\alpha$ -open. Since  $A$  is wgru-I-closed,  $cl^*(int(A)) \subseteq X - U$ . Which implies that  $U \subseteq X - cl^*(int(A))$ . Thus  $U \subseteq (cl^*(int(A)) \cap (X - cl^*(int(A)))) = \emptyset$ . Hence  $cl^*(int(A)) - A$  contains no non-empty regular  $\alpha$ -open set.

**Theorem: 3.17**

Let  $(X, \tau, I)$  be an ideal space and  $A \subseteq X$ . If  $A$  is wgru-I-closed, then  $cl^*(int(A)) - A$  contains no non-empty regular  $\alpha$ -closed set.

**Proof** Follows from theorem: 3.16.

**Theorem: 3.18**

Let  $(X, \tau, I)$  be an ideal space and  $A \subseteq X$ . If  $A$  is wgru-I-closed, then  $cl^*(int(A)) - A$  contains no non-empty regular open set.

**Proof** Follows from theorem: 3.16 and the fact that every regular open set is regular  $\alpha$ -open.

**Theorem: 3.19**

Let  $(X, \tau, I)$  be an ideal space and  $A \subseteq X$ . If  $A$  is wgru-I-closed, then  $(int(A))^* - A$  contains no non-empty regular  $\alpha$ -open set.

**Proof**

Let  $A$  be a wgru-I-closed set in  $X$ . Suppose that  $U$  is a regular  $\alpha$ -open set such that  $cl^*(int(A)) \subseteq X - U$ , which implies that  $(int(A))^* \subseteq X - U$ , thus  $(int(A))^* - A$  contains no non-empty regular  $\alpha$ -open set.

**Theorem: 3.20**

Let  $A$  be a wgru-I-closed set of an ideal topological space  $X$ . Then the following are equivalent.

- (i)  $A$  is I-R-closed.
- (ii)  $cl^*(int(A)) - A$  is a regular- $\alpha$ -closed set.
- (iii)  $(int(A))^* - A$  is a regular- $\alpha$ -closed set.

**Proof**

(i) $\Rightarrow$ (ii) Let  $A$  be I-R-closed. We have  $cl^*(int(A)) = A$ , then  $cl^*(int(A)) - A = \emptyset$ . Thus,  $cl^*(int(A)) - A$  is a regular- $\alpha$ -closed set.

(ii)⇒(iii) Let  $cl^*(int(A)) - A$  be regular- $\alpha$ -closed.  $Cl^*(int(A)) - A = (int(A))^* - A$ . Therefore  $(int(A))^* - A$  is a regular- $\alpha$ -closed set.

(iii)⇒(i) Let  $(int(A))^* - A$  be a regular- $\alpha$ -closed set,  $cl^*(int(A)) - A = (int(A))^* - A = \emptyset$ . Thus  $cl^*(int(A)) = A$ . Hence  $A$  is I-R-closed.

**Theorem: 3.21**

Let  $(X, \tau, I)$  be an ideal space and  $A \subseteq X$ . If  $A$  is wgr $\alpha$ -I-closed, and whenever  $A \subseteq U$  and  $U$  is a regular-open set in  $X$ , then  $A$  is weakly  $I_{\alpha}$ -closed set.

**Proof**

Let  $A$  be a wgr $\alpha$ -I-closed set, we have,  $cl^*(int(A)) \subseteq U$ . Then  $(int(A))^* \subseteq U$ . By hypothesis,  $A$  is weakly  $I_{\alpha}$ -closed set.

**Theorem: 3.22**

Let  $(X, \tau, I)$  be an ideal space and  $A \subseteq X$ . If  $A$  is regular-open and wgr $\alpha$ -I-closed, then  $A$  is  $\alpha$ -closed set.

**Proof**

Let  $A \subseteq A$  and  $A$  be regular open. Since  $A$  is wgr $\alpha$ -I-closed in  $X$ ,  $cl^*(int(A)) \subseteq A$ , which implies that,  $cl^*(A) = cl^*(int(A)) \subseteq A$ . Therefore  $A$  is  $\alpha$ -closed set in  $X$ .

**Theorem: 3.23**

Let  $(X, \tau, I)$  be an ideal space. Then either  $\{x\}$  is regular closed (or)  $X - \{x\}$  is wgr $\alpha$ -I-closed for every  $x \in X$ .

**Proof**

Suppose  $\{x\}$  is not regular-closed, then  $X - \{x\}$  is not regular-open and the only regular-open set containing  $X - \{x\}$  is  $X$  and  $cl^*(int(X - \{x\})) \subseteq X$ . Hence  $X - \{x\}$  is wgr $\alpha$ -I-closed set in  $X$ .

**Theorem: 3.24**

Let  $(X, \tau, I)$  be an ideal space,  $A$  is regular-open and  $A \subseteq X$ . Then the following properties are equivalent.

- (i)  $A$  is  $\alpha$ -closed.
- (ii)  $A$  is I-R-closed.
- (iii)  $A$  is wgr $\alpha$ -I-closed

**Proof**

(i)⇒(ii) Let  $A$  be  $\alpha$ -closed and regular-open,  $cl^*(int(A)) = cl^*(A) = A$ . Thus,  $A$  is I-R-closed.

(ii)⇒(iii) Let  $A \subseteq A$  and  $A$  be regular open. Since  $A$  is I-R-closed and every regular-open set is regular- $\alpha$ -open,  $cl^*(int(A)) \subseteq A$ . Thus  $A$  is wgr $\alpha$ -I-closed.

(iii)⇒(i) follows from theorem 3.22.

**Theorem: 3.25**

Let  $A$  be a wgr $\alpha$ -I-closed set in an ideal space  $X$  such that  $A \subseteq B \subseteq cl^*(int(A))$ , then  $B$  is also an wgr $\alpha$ -I-closed set.

**Proof**

Let  $U$  be an regular  $\alpha$ -open set of  $X$ , such that  $B \subseteq U$ . Then  $A \subseteq B \subseteq U$ . Since  $A$  is wgr $\alpha$ -I-closed,  $cl^*(int(A)) \subseteq U$ . Now  $cl^*(int(B)) \subseteq cl^*(int(cl^*(int(A)))) = cl^*(int(A)) \subseteq U$ . Therefore  $B$  is wgr $\alpha$ -I-closed.

**Theorem: 3.26**

Let  $A$  be a wgr $\alpha$ -I-closed set in an ideal space  $X$ . Then  $A \cup (X - cl^*(int(A)))$  is wgr $\alpha$ -I-closed if and only if  $(int(A))^* - A$  is wgr $\alpha$ -I-open.

**Proof**

Let  $(\text{int}(A))^* - A$  be  $wgr\alpha$ -I-open in  $X \Leftrightarrow X - ((\text{int}(A))^* - A)$  is  $wgr\alpha$ -I-closed.

$$\begin{aligned} X - ((\text{int}(A))^* - A) &\Leftrightarrow X \cap ((\text{int}(A))^* \cap A)^c \\ &\Leftrightarrow AU(X - \text{cl}^*(\text{int}(A))). \end{aligned}$$

Hence the proof.

**Theorem: 3.27**

Let  $(X, \tau, I)$  be an ideal space and  $A \subseteq X$ . Then  $A$  is  $wgr\alpha$ -I-open if and only if

$$U \subseteq \text{int}^*(\text{cl}(A)), \text{ whenever } U \text{ is regular } \alpha\text{-open and } U \subseteq A.$$

**Proof**

Let  $A$  be  $wgr\alpha$ -I-open and  $U$  be a regular  $\alpha$ -open set in  $X$  contained in  $A$ .  $X - U$  is also regular  $\alpha$ -open set containing  $X - A$  and  $X - A$  is  $wgr\alpha$ -I-closed, we have  $\text{cl}^*(\text{int}(X - A)) \subseteq X - U$ . Which implies that  $X - \text{int}^*(\text{cl}(A)) \subseteq X - U$ . Thus  $U \subseteq \text{int}^*(\text{cl}(A))$ .

Conversely,  $U \subseteq \text{int}^*(\text{cl}(A))$ , whenever  $U$  is regular  $\alpha$ -open and  $U \subseteq A$ . We have  $X - A \subseteq U$ . Then

$$X - U \subseteq A \text{ and so } X - U \subseteq \text{int}^*(\text{cl}(A)). \text{ Therefore } \text{cl}^*(\text{int}(X - A)) \subseteq U. \text{ Hence } A \text{ is } wgr\alpha\text{-open.}$$

**Theorem: 3.28**

Let  $(X, \tau, I)$  be an ideal space and  $A \subseteq X$ . If  $A$  is  $wgr\alpha$ -I-closed, then  $\text{cl}^*(\text{int}(A)) - A$  is a  $wgr\alpha$ -I-

open set in  $X$ .

**Proof**

Let  $A$  be a  $wgr\alpha$ -I-closed set in  $X$ . Suppose that  $U$  is a regular  $\alpha$ -open set such that  $U \subseteq \text{cl}^*(\text{int}(A)) - A$ . Since  $A$  is  $wgr\alpha$ -I-closed, it follows from theorem 3.16 that  $U = \emptyset$ . Thus, we have  $U \subseteq \text{int}^*(\text{cl}(\text{cl}^*(\text{int}(A)) - A))$ , by theorem 3.27,  $\text{cl}^*(\text{int}(A)) - A$  is  $wgr\alpha$ -I-open in  $X$ .

**Theorem: 3.29**

Let  $A$  be a  $wgr\alpha$ -I-open set in an ideal space  $X$  and  $A \subseteq X$  such that  $\text{int}^*(\text{cl}(A)) \subseteq B \subseteq A$ , then  $B$  is also an  $wgr\alpha$ -I-open.

**Proof**

Since  $A$  is  $wgr\alpha$ -I-open, then  $X - A$  is  $wgr\alpha$ -I-closed.  $\text{cl}^*(\text{int}(X - A)) - (X - A)$  contains no non-empty regular  $\alpha$ -open set. Since  $\text{int}^*(\text{cl}(A)) \subseteq \text{int}^*(\text{cl}(B))$ , we have  $\text{cl}^*(\text{int}(X - B)) \subseteq \text{cl}^*(\text{int}(X - A))$ , which implies that  $\text{cl}^*(\text{int}(X - B)) - (X - B) \subseteq \text{cl}^*(\text{int}(X - A)) - (X - A)$ . Thus  $B$  is  $wgr\alpha$ -open.
