INTRODUCTION

Today, sports have become a part and parcel of our culture. It is being influenced and does influence all our social institutions including education, economics, arts, politics, law, mass communication and even international diplomacy (Alaguraja, K. et.al, 2019). Yoga is universally benefiting all people of all ages. The study of Yoga is fascinating to those with a philosophical mind and is defined as the silencing of the mind's activities which lead to complete realization of the intrinsic nature of the Supreme Being (Alaguraja, K. et.al., 2017). In the sports world, physical education is the most essential aspect due to the fact physical schooling increases the performance and the effectiveness of the sports (Alaguraja, K. et.al., 2018).

Yoga is a system of exercises which helps the mind and body in order to achieve tranquility and spiritual insight (Alaguraja, K. et.al., 2019). Make sure that when you practice yoga asanas, you don't just stretch the body because the mind has to be with the body. (Alaguraja, K. et.al, 2019). One can start practicing Yoga at any given moment of time and you may start with meditation or directly with pranayama without even doing the asanas (postures). (Alaguraja, K. et.al, 2019). Today's there is an escalating emphasis on appearing smarter, feeling etter and living longer. In order to achieve these ideals as, scientific evidence tells us that one of the keys is high fitness and exercises (Alaguraja, K. et.al, 2019). When consciousness is operating with the intellect and with all the senses, by making an individual think that he or she is awake and aware, but the mind is actually less receptive and more critical (Yoga, P. et al., 2019).

RESEARCH METHODOLOGY

Selection of subjects

The purpose of the study was to find out the effect of combined pranayama and meditation practices on self confidence among hockey players. To achieve this purpose of the study, thirty girl's hockey players were selected as subjects at random. The age of the subjects were ranged from 14 to 17 years.

SELECTION OF VARIABLE

Dependent Variable
- Combined pranayama and meditation practices

Independent variable
- Self confidence

EXPERIMENTAL DESIGN AND IMPLEMENTATION

The selected subjects were divided into two equal groups of fifteen subjects each, such as a combined pranayama and meditation practices group (Experimental Group) and control group. The experimental group underwent combined pranayama and meditation practices for five days per week for six weeks. Control group, which they did not undergo any special training programme apart from their regular physical activities as per their curriculum. The following psychological variable namely Self confidence was selected as criterion variable. All the subjects of two groups were tested on selected criterion variable Self confidence was measured through Vealy's trait sports confidence inventory (TSCI) assessment method at prior to and immediately after the training programme.

*Significance at .5 level of confidence.

The Table-I and II shows that the mean values of pre-test and post-test of the control group on Self confidence were 75.53 and 75.93 respectively. The obtained ‘t’ ratio was 1.14, since the obtained ‘t’ ratio was less than the required table value of 2.14 for the significant at 0.05 level with 14 degrees of freedom it was found to be statistically non significant at 0.05 level of confidence.
The mean values of pre-test and post-test of the experimental group on Self confidence were 73.4 and 83.13 respectively. The obtained 't' ratio was 14.47* since the obtained 't' ratio was greater than the required table value of 2.14 for significance at 0.05 level with 14 degrees of freedom it was found to be statistically significant. The result of the study showed that there was a significant difference between control group and experimental group in Self confidence. It may be concluded from the result of the study that experimental group improved in Self confidence due to six weeks of combined pranayama and meditation practices.

**Figure-1 Bar Diagram Showing the Pre and Post Mean Values of Experimental and Control Group on Self confidence**

**DISCUSSIONS ON FINDINGS**
The result of the study indicates that the experimental group, namely combined pranayama and meditation practices group had significantly improved the selected dependent variable, namely Self confidence, when compared to the control group. It is also found that the improvement caused by combined pranayama and meditation practices when compared to the control group.

**CONCLUSION**
On the basis of the results obtained the following conclusions are drawn,
1. There was a significant difference between experimental and control group on Self confidence after the training period.
2. There was a significant improvement in Self confidence. However the improvement was in favor of experimental group due to six weeks of combined pranayama and meditation practices.
