ABSTRACT
Background: Stress, anxiety and depression are known to be significant factors in the onset and progression of a wide spectrum of illness ranging from cardiovascular diseases, asthma, cancer, HIV-infection & affects multiple systems of body. Yoga practices are time-honored stress management/health promotion techniques whose health benefits are being validated by modern medical science. Independent research has shown that significantly reduced levels of cortisol reduce the level of stress, relieve anxiety, depression, increase anti-oxidant production, enhance brain function, enhance health well-being and peace of mind.

Aims & objectives: The aim of present study was to study the “Effect of Yoga (yogic exercises, pranayama and meditation) on serum cortisol and hyper-reactivity to cold pressor test in young healthy medical students”

Material and method: The present study included 60 male medical students of first M.B.B.S. of 18 to 25 years of age. After recording the basal serum cortisol level, blood pressure and pulse rate, the cardiovascular reactivity of all the 60 students was measured by application of cold pressor test devised by Hines & Brown(1934).30 were found to be hyper reactors to this test. These hyper reactors under went yogic exercises, pranayama and meditation for the duration of 12 weeks. After the yogic training period the serum cortisol level, level, blood pressure and pulse rate was again measured which was found to be significantly reduced.

Result: Regular practice of yoga is effective in reducing the stress level as indicated by reduction in the serum cortisol level and cardiovascular hyper-reactivity.

Conclusion: Modern man is the victim of stress and stress related disorders which threaten to disrupt his life totally. Being holistic in its approach, yoga offers the best way out of this ‘whirlpool of stresses. Yogic lifestyle, yogic diet, yogic attitudes and various yogic practices help man to strengthen his body and mind and develop positive health, enabling him to withstand stress by normalizing the perception of stress, optimizing the reaction to it and by effectively releasing the pent-up stress through various yogic practices.

INTRODUCTION
Stress is described as a state of anxiety, strain, nervousness, tension, constant worry or pressure. It is an accepted fact that psychosocial factors operate through mental processes, consciously or unconsciously, to produce hypertension and other cardiovascular disorders.

Stress, anxiety and depression are known to be significant factors in the onset and progression of a wide spectrum of illness ranging from cardiovascular diseases, asthma, cancer, HIV-infection & affects multiple systems of body. Yoga practices are time-honored stress management/health promotion techniques whose health benefits are being validated by modern medical science. Independent research has shown that significantly reduced levels of cortisol reduce the level of stress, relieve anxiety, depression, increase anti-oxidant production, enhance brain function, enhance health well-being and peace of mind.

Psychosocial stresses of our modern life precipitates various cardiovascular and other disorders by disturbing basic neuroendocrine mechanism. The psychosocial stresses activate limbic system and hypothalamus which stimulate autonomic nervous system, increase in output of both adrenaline and nor-adrenaline, both from sympathetic nerve fibres as well as from adrenal medulla causing increase in heart rate, systolic and diastolic blood pressures, & an increased secretion of glucocorticoid & aldosterone from adrenal cortex causing salt and fluid retention which increases blood volume and blood pressure imposing severe strain on the heart.

The stress hormone, cortisol, is public health enemy number one. Scientists have known for years that elevated cortisol levels: interfere with learning and memory, lower immune function and bone density, increase weight gain, blood pressure, cholesterol, Heart diseases & elevated cortisol levels act as a potential trigger for mental illness and decreased resilience—especially in adolescence.

Factors contributing to high levels of stresses in professional colleges could be highly competitive curriculum, intense academic competition, excessive demands on coping abilities in physical, emotional, intellectual, financial and social terms. Possibly these and many more factors contribute to high levels of stress in medical students.

In the study of hypertension, cold pressor test, introduced by Hines and Brown, was employed to measure the cardiovascular reactivity. The persons hyper-reactive to cold pressor test are susceptible for early onset of hypertension. We tested whether regular practice of Yoga for 3 months can reduce the serum cortisol level & cardiovascular hyper-reactivity, for reducing the morbidity and mortality from cardiovascular disorders.

“Yogic” postures are now, one of the non-pharmacological therapies against stress and strain."Yoga" practice has been shown to be effective in improving mood and decreasing stress and depression.

In the ancient system of education various yogic practices like Suryanamaskar, Pranayama, meditation as well as good value systems were introduced with the formal education to enable the development of good physique, strong ethical values and
Yoga can protect the individual by bringing harmony between mind and body, modulating stress responses and one's attitude to stress as also improving mental faculties such as attention, memory, learning efficiency and positive attitude to life[12, 11, 14]. Total growth of personality at physical, mental, intellectual and social level can result with the regular practice of yoga [15]. At physical level regular practice of asanas, pranayama bestows a proportionate, flexible, normally relaxed body with an ability to withstand stress efficiently [16]. Yoga is the best lifestyle modification, which aims to attain the unity of mind, body and spirit through asanas, pranayama, and meditation [17]. At critical times necessary energy gets evoked to deal with the stressful state [7]. At intellectual level, yoga can sharpen memory, concentration, decrease anxiety levels [15, 16]. At spiritual level yoga creates an awareness to look for happiness within oneself and to be at peace with oneself.

The present study has been undertaken with the aim of desensitizing the hyper-reactors by practicing yogic exercises, Pranayama, and Meditation, because hyper-reactors are likely to develop hypertension and other stress related diseases in future life. Ours is a humble attempt towards restoring the peace and normalcy of life and this gives a message to human beings that the regular and proper practice of yoga produces an inner balance of mind that remains stable and this is the best way to maintain the health and longevity without financial burden.

Material & Methods:
Study group comprised 60 male healthy subjects of 18-25 years. They were subjected to cold pressor test according to Hines & Brown, [19]. Out of 60 volunteers, 30 turned out to be hyper-reactive to this provocative test. The hyper-reactivity of 30 volunteers converted to hypo-reactivity after the yoga therapy of three months(100%). The parameters like rise in serum cortisol level, basal blood pressure, rise in blood pressure, pulse rate were also significantly reduced statistically by using student’s t test.

The study protocol was explained to the subjects and written consent obtained. Approval by ethical committee of S.S. Medical College, Rewa, M. P., was obtained. All the volunteers were clinically examined to rule out any systemic diseases. All subjects were non-alcoholic and non-smokers. They were not taking any drugs, and they had similar dietary habits as well as physical and mental activities at work and home. They were not practicing any known stress relieving or relaxation technique previously.

- All the 30 volunteers of study group were trained under the guidance of a certified "yoga" teacher for 15 days in the Deptt. Of Physiology. They carried out "Yogasanas, Pranayama and Meditation" 60 minutes, twice a day for three months, under supervision, in a prescribed manner. The schedule consisted of-
  - Yogasanas- -10 minutes
  - Pranayama- -10 minutes
  - Meditation- -40 minutes
  - The asanas practiced were: Ardhachakrasana, Tadasana, Paschimottanasana, Uthitha Trikonasana, Vajrasana, Salamba Sarvangasana, and Halasana.
  - The Pranayama performed was: Ujjayi
  - The volunteers practiced these exercises early in the morning and in evening, in a quiet, well ventilated room or in open air space sitting in a comfortable posture.
  - The Meditation performed was: the same, as was told by Lord Krishna to Arjun in Kuruchhetra (Method is available in Bhagvat Geeta. 9th to 16 slokes of Dhana Yoga chapter)
  - BP was measured in supine posture by Sphygmomanometer.

Results:
Due to cold pressor test, the mean systolic blood pressure was 123.9 to 2.96 mm Hg, mean diastolic blood pressure 81.8 to 3.49 mm Hg, mean basal Pulse rate 77.0 to 5.19/ min & basal Serum cortisol level 10.06 ± 0.582 microgram / dl

Due to cold pressor test, the mean rise in systolic blood pressure, was 145.1 to 2.803 mm Hg (p<0.000 ). While the rise in diastolic blood pressure was 98.27 ± 3.74 mm Hg, (p<0.000 ). Rise in Pulse rate 85.33 ± 5.10 / min (p<0.000 ), & rise in Serum cortisol level 12.72 ± 0.533 microgram / dl (p<0.000 ).

The effect of 03 months of yoga only in study group:
The mean systolic blood pressure decreased from 123 ± 2.96 mm Hg to 119.7 ± 1.96 mm Hg (p<0.000), mean diastolic Blood pressure was decreased from 81.8 ± 3.49 to 77.9 ± 4.20 mm Hg (p<0.000), mean Pulse rate was decreased from 77.0 ± 5.19/ min to 74.53 ± 4.85/ min (p<0.000), & mean Serum cortisol level was decreased from 10.06 ± 0.582 microgram / dl to 9.07 ± 0.95 microgram / dl (p<0.000), after 3 months of yogic exercises, pranayama and meditation & were statistically highly significant. (Table-2)

Discussion:
On analyzing the effect of yoga on hyper reactor subjects of first-year MBBS student age group 18-25 years, in our study, the level of serum cortisol & cardiovascular autonomic function tests were studied in study group before yoga & after three months of “yoga” (Asana, Pranayama & Meditation), the study group...
volunteers showed the effect of cold pressor test on mean serum cortisol, mean systolic blood pressure, mean diastolic blood pressure & mean pulse rate were increased (p<0.000) due to increase sympathetic activity of nervous system & were statistically highly significant.

Due to regular practices of yoga, mean serum cortisol, mean systolic blood pressure, mean diastolic blood pressure & mean pulse rate were decreased (p<0.000) & due to autonomic equi- librium between sympathetic and parasympathetic nervous system & were statistically highly significant. In the present study we observed that there was statistically more significant decrease in serum cortisol, blood pressure & pulse rate, after practicing “yoga” which indicates decrease in sympathetic activity and increase in parasympathetic activities which is mainly due to increase in vagal tone. [18, 19, 20, 21] 

On Transcendental Meditation, the cortisol levels was a significant drop in the meditation group [22, 23, 24, 25] mainly due to decrease release of stress hormone " cortisol " from adrenal cortex .

The significant decrease in resting pulse rate, systolic and diastolic blood pressure after the yoga practice in the present study is in accordance with the findings of other studies on physiological effects of yoga practice in healthy individuals. [34] Similar reduction in resting PR and blood pressure after yoga practice were also reported in hypertensive patients, [20, 24] in asthmatic patients [35] and in diabetic patients. [36] can be attributed to modulation of autonomic activity with parasympathetic predominance and relatively reduced sympathetic tone. This autonomic modulation in yoga is mediated through modification of breathing patterns which triggers various central and autonomic mechanisms as well as mechanical and hemodynamic adjustments causing both tonic and phasic changes in cardiovascular functioning. [31] The mean values of pulse rate, systolic blood pressure and diastolic blood pressure are highly significant reduction after 6 months of yoga practice. Reduction in heart rate and blood pressure indicate a shift in the balancing components of autonomic nervous system towards the parasympathetic activity which was reported by Santha Jose et al. [32, 33] This modulation of autonomic nervous system activity might have been brought about through the conditioning effect of yoga on autonomic functions and mediated through the limbic system and higher areas of central nervous system was reported. [34] Regular practice of yoga increases the baroreflex sensitivity and decreases the sympathetic tone, thereby restoring blood pressure to normal level in patients of essential hypertension was reported. [35] Meditation by modifying the state of anxiety reduces stress – induced sympathetic over activity thereby ”In a tension-filled society, yoga, pranayama, and meditation alone will bring solace from problems and hence they are essence of the life”.

The practice of “asanas” relaxes the muscles and joints which influences the hemodynamic mechanism, thereby improving blood circulation to vital organs. This may also activate the neuro-endocrine axis which is important in facing physical and mental stress. Restoring equilibrium, thereby avoiding intervention of inhibitory parasympathetic system. [36] Combined practice of physical posture, breathing exercises, and meditation, needs of society, thus yoga to stop the stress response. [37]

Yoga with physical, emotional, mental, personality development and holistic understanding offers to cope with stressful states. To meet the modern lifestyle full of challenges, stress and tensions an all round personality development has become mandatory for the student. The aspect of relaxation and detachment is lacking in our education process and it is this new dimension that needs to be added to the curriculum. Thus yoga can be beneficial in achieving a tranquil state of mind during routine activities and yet providing then concentration and arousal essential in demanding or stressful situations like examinations. [34]

**CONCLUSION:**
Non pharmacological methods like yogic asanas, pranayama, and meditation should be encouraged to control the modifiable risk factors by increasing parasympathetic activity and decreasing sympathetic activity and provides significant improvements in cardiovascular parameters and respiratory functions. It can thus be concluded that these results would justify the incorporation of yoga as part of our life style in prevention of hyper-reactivity to stress related disorders and age–related cardiovascular complications.

“In a tension-filled society, yoga, pranayama, and meditation alone will bring solace from problems and hence they are essence of the life”.
