ABSTRACT

In a Green Highway Revolution, save energy, material and increase the productivity of the people working in the building the highway/highway designer who trying their best to protect the green environment by designing and constructing green highway. The natural environment is the most precious resource we have as it sustains all forms of life on the earth. Due to the mismanagement of the environment many socio-economic problems have cropped up. To overcome these problems the World Green Highway Council, a top global not-for-profit organization is working to transform the property industry towards sustainability. Green Highways constitute transportation functionally and ecological sustainability so that transportation requirements and environmental functions are better than before.

Keywords: Six sigma, DAMIC, DMADV, Kizen, Kanban, 5S

General:
Green highway technology was initiated in USA since the year 2002 and then after it is being persuaded in that country though public private participation, a social group, known as Green Highway Partnership (GHP). The nationwide group of GHP in USA has also identified the characteristics of Green Highway and rating system of Green Roads. The Authority intends to start the systematic educative social movement including applications of Green Highway technology wherever possible in India on the similar pattern of GHP in USA.

In pursuance of the above technology, the Authority has undertaken the studies of Green Highway so as to formulate its general characteristics suitable to Indian environment and promote the use of Green aspects of the highway wherever possible. To work out more details on the subject and to formulate the action plan, it is proposed to constitute a Public Private Association in India viz. Green Highway Association India (GHAI). Such association and its branches at project level, Taluka level, District level, State level and National level shall work to promote the concept of Green Highway after formulating the characteristics and rating methodology for Green Highways.

Green Highway concept may go on developing in days to come depending upon Socio-economic priorities and research data that may come forth for adding or deleting in the present concept. Highway Research Center has undertaken the above work of implementing the concept of Green Highway in India and making available information on the subject to the concerned peoples & institutes including training to highway engineers.

Brief consideration for Green Highway:
Green Highways constitute transportation functionally and ecological sustainability so that transportation requirements and environmental functions are better than before. The expected contribution of Green Highways include reduced use of virgin materials, reduced energy use, mitigation of environmental burden, promotion of human health and safety, optimization of habitat and land use, improve business and communication and most important is reaffirm our commitment to future generation also. The traditional highway can be converted into green highway right from design process and shall undergo desired changes during construction and maintenance phases. Before the formulation of common characteristics of green highway it is always advantageous to understand the green practices to be followed during process of designs, construction and maintenance of highway. The below discussed green practices are not final and may change during days to come depending upon the research data that may come forth in this respect. Some of the practices may have to be replaced or some of the new practices shall have to be newly added depending upon social priorities and invented alternative practices in that time.

One more important aspect we have to keep in mind is that the green highway initiative is the voluntary social movement comprising Govt. authorities of highway Dept. Environmental and Ecological department, other concerned Govt. Dept. Social institutions, private contractors, labour unions and parties helpful in implementing the social goals of green highway. The green highway is not any Govt. stipulation of laws but the results of composite efforts rendered by public private associations. There are various Govt. stipulations and laws on minimum environmental requirements but we have to go much beyond these requirements and compliances so as to protect, as far as possible, the environmental and ecological process to its natural form without much impact of highway construction.

The brief description of each of the above area, to be developed to produce green highway, are given below.

1) Watershed driven storm water management:
Watershed driven storm water management is significant in reducing the storm water runoff from a highway as well as treating the runoff by natural ways. Storm water management is the techniques for holding and treating the runoff produced by a highway and diverting the storm water runoff to areas where it can infiltrate to the ground water table. The green infrastructure practices protect runoff water quantity and qual-
Green Highway considerations at construction stage:
The designs considerations of green highway shall have to be
well studied before the project put to execution and following
aspects shall have to be strictly adhering to during execution
so as to convert the highway project into green highway.

1) Reduce vehicle/ machinery fuel consumption & lower
down fuel demand than estimated in actual construction.
2) Utilization of natural resources & virgin materials to bare
minimum extent than estimated.
3) Recycling of byproducts and industrial waste viz.: rubber,
fly ash, plastic, glass etc. in the locality shall be
given priority.
4) Utilization of low electrical equipments viz. CFL, LED,
LCD etc. on project site shall have to be ensured.
5) Selection and use of efficient construction equipments
and plants which will help to reduce the pollution during
construction. Monitor the performance of such plants pe-
riodically.
6) Utilization of natural and renewable energy source far
camps, offices and execution site areas i.e. solar panels
eetc.
7) Minimize the waste of every kind. Disposal of hazardous
and non-hazardous waste from construction site and re-
porting its environmental compliances to concerned au-
thorities.
8) Utilization of spill control techniques and recycling tech-
niques wherever possible.
9) Measuring & keeping record of environmental damages
during construction phases in terms of air, water, land,
flora, fauna & its special impact with sophisticated testing
equipments.
10) It is most important to plant large canopy trees along both
sides of highway. One should remember that one sqm.
of green canopy absorb 0.2 kg of CO2 and other waste
gases. Tree plantation interact the storm water, mitigate

It is a challenging job to researchers to develop suitable and
economical tools which will aid in design & analysis of storm
water management and treatment alongside of highways.

The following few research opportunities in storm water man-
gagement are listed below which are also hinted for develop-
ment

i) Cost-benefit analysis of maintenance practices of storm
water management (SM)
ii) Commonly applicable O & M practices for SM.
iii) Minimizing maintenance requirements of SM.
iv) Methodology of SM performance & designs.
v) Identification of critical needs within watershed for SM.
vi) Analysis of pollution reduction in water in SM.
vii) Cost-benefit demo for SM mitigation.

Green Highway considerations at construction stage:
The designs considerations of green highway shall have to be
well studied before the project put to execution and following
aspects shall have to be strictly adhering to during execution
so as to convert the highway project into green highway.

1) Reduce vehicle/ machinery fuel consumption & lower
down fuel demand than estimated in actual construction.

sides of highway. One should remember that one sqm.
of green canopy absorb 0.2 kg of CO2 and other waste
gases. Tree plantation interact the storm water, mitigate

by two ways. First they reduce the amount of pollutants at
site and ultimately are discharged into adjacent water bodies.
Secondly they reduce the water that runs off the site. Infiltr-
tration & evapotranspirations of storm water are two natural
methods of storm water treatment. The suitable methodolo-
gies for storm water management within ROW shall have to
be evolved considering the present practices. In USA, tech-
nologies like bio-retention (Landscape designed to remove
silt and pollution from surface water runoff), pervious pave-
ment, shoulders, environ friendly concrete, forest buffers,
restored and storm water wetlands, stream restoration, soil
amendments, wild life crossings etc. are being used. The field
of watershed driven storm water management is constantly
evolving and need attention of researchers.

It is a challenging job to researchers to develop suitable and
economical tools which will aid in design & analysis of storm
water management and treatment alongside of highways.

evolving and need attention of researchers.

It is a challenging job to researchers to develop suitable and
economical tools which will aid in design & analysis of storm
water management and treatment alongside of highways.

The following few research opportunities in storm water man-
gagement are listed below which are also hinted for develop-
ment

i) Cost-benefit analysis of maintenance practices of storm
water management (SM)
ii) Commonly applicable O & M practices for SM.
iii) Minimizing maintenance requirements of SM.
iv) Methodology of SM performance & designs.
v) Identification of critical needs within watershed for SM.
vi) Analysis of pollution reduction in water in SM.
the temperature, improve air quality and prohibit soil erosions. Median portions between lanes of highway shall also be used for plantation of herbs & shrubs so as to reduce CO2 and help to generate oxygen. Use more local species during the plantation which deliver more severity rate & reduce the rework of plantation.

11) It should be ensured that the compliances of environmental rules & regulations shall be much beyond the stipulated limitations.

Green Highway consideration during maintenance of highway:
1) Monitoring of plantation growth & implement techniques to increase the severity of plantations and survival ratio.
2) Monitoring ambient air quality & noise quality after construction.
3) The typical vehicles plying on the highway viz. S.T. buses, trucks, multi-axle vehicles etc. can be assessed for their life maintenance, fuel consumptions, travel life (in kms.) etc. so as to estimate the carbon emission by transportation system as a whole & methodology to reduce down the same and shrinking the related carbon footprints. The goal of sustainable transportation is to protect the environment & conserve natural resources while taking into consideration social need and cost-benefit ratio. The efforts shall have to make in association with transportation sector to reduce the emission of carbon and other detrimental foul gases that affect the environment.

Benefits of Green Highways:
Green highway is associated with a variety of social environmental, economic & human health benefits. The benefits of green infrastructure are particularly accentuated in urban & suburban areas where green space is limited & environmental damages are more extensive. Green infrastructure benefits include:

i) Social benefits: Highway has an important impact on local economies. Highway can draw a business into local society & provide local jobs & tax income. Due to decrease of materials in land fill, the land fill space will be decreased ultimately reducing user costs for communities around the land fill. Reduction in noise and reduced pollution from highways can increase the quality of life in the area. Similarly other benefits viz. decreased water use, use of recycled materials, protection to wildlife, decreased amount of pollutants Contained in surface runoff & increase in stream & recreational water quality etc. benefits can also be availed by the society.

ii) Reduced & delayed storm water runoff volumes: Green infrastructure techniques increase storm water infiltration rates, thereby reducing the volume of runoff entering into sewer systems & ultimately at lake, rivers & streams.

iii) Enhanced groundwater recharge: The natural infiltration capabilities of green infrastructure technologies can improve the rate at which ground water tables are ‘recharged’ or replenished. Enhanced ground water recharge can also boost the supply of drinking water for private & public uses.

iv) Storm water pollutant reductions: Green highway techniques infiltrate runoff close to its source & help to prevent pollutants from being transported to nearby surface waters. Once runoff is infiltrated into soils, plants & microbes can naturally filter & break down many common pollutant found in storm water.

v) Reduced sewer overflow events: Utilizing the natural retention & infiltration capabilities of plants & soils, green infrastructure limits the frequency of sewer overflow events by reducing runoff volumes & by delaying storm water discharges.

vi) Increased carbon sequestration: The plantation & soils which are the part of green highway approach serve as sources of carbon sequestration. In this process CO2 is captured & removed from the atmosphere via photosynthesis & other natural process.
