Research Paper

Effect of Yogic Exercises on State Anxiety and Trait Anxiety Among The Adolescents

Dr. Amalesh Adhikari
Asstt. Prof. in Physical Education, Vivekananda Mission Mahavidyalaya, Chaitanyapur (Haldia); Purba Medinipur, West Bengal; India

ABSTRACT
An attempt has been made to investigate the Effect of Yogic Exercises on State Anxiety and Trait Anxiety among the adolescents. 100 male students of U.G. college level were practiced different types of yogic exercises like Surya Namaskar, Asanas, Pranayam and Meditation for eight weeks by maintaining a schedule. The trait anxiety and state anxiety were measured by Spielberger's State Trait Anxiety Inventory (STAI). Pre-test and Post-test results were taken and compared by employing ‘t’ test. In results, it was found that there was significant difference between pre-test and post-test. So, it was evident that yogic exercises impact significantly on state anxiety and trait anxiety among the adolescents.

KEYWORDS
Yogic Exercises, Trait Anxiety, State Anxiety, Adolescents, Surya Namaskar, Asanas, Pranayam, Meditation etc.

INTRODUCTION
Yogic exercises are the important aspects in our life. Yoga is the art of living (Ajmeer Singh et. al., 2008). It includes Yama, Niyama, Asana, Pranayama, Dharana, Dhyana and Samadhi. It is also considered as a way of life. Practice of yoga is being emphasized in all institutional level.

Anxiety is an important bio-psychological parameter in our life. It is a multidimensional construct which reflects emotional impact or cognitive dimension of arousal. Martens (1977) suggested that anxiety reactions would result from an objective environmental demand interpreted as threatening by an individual.

There are two kinds of anxiety like state anxiety and trait anxiety. Spielberger (1983) described state anxiety as existing in a transitory emotional state that varies in intensity and fluctuates over time. On the other hand, trait anxiety refers to a stable susceptibility or a proneness to experience state anxiety frequently.

State anxiety may be denoted as an emotional state, characterized by subjective, consciously perceived feelings of apprehension and tension, accompanied by or associated with or associated with activation or arousal of the autonomic nervous system. On the other hand, trait anxiety may be denoted as a motive or acquired behavioral disposition to perceive a wide range of circumstances as threatening and respond to state anxiety.

Statement of the problem
The problem of the study was to investigate the effect of yogic exercises on state anxiety and trait anxiety among the adolescents.

Hypothesis
It was hypothesized that yogic exercises have the positive effect on state anxiety and trait anxiety among the adolescents.

Delimitations
1. Only male students were selected.
2. No. of students was hundred.

Limitations
Subjects are not from the same cultural group, economical status, educational and family background, food habits, nutrition and mental growth. Thus any influence of those factors on personality, will be beyond the control of the investigator.

PROCEDURE
Selection of Subjects
100 male students of U.G. level of Vivekananda Mission Mahavidyalaya were practiced different types of yogic exercises like Surya Namaskar, Asanas, Pranayam and Meditation for eight weeks by maintaining a schedule.

Criterion Measures
To determine state anxiety and trait anxiety, Spielberger’s State Trait Anxiety Inventory (STAI) was employed. Pre-test and Post-test results were taken and compared among them.

Statistical Analysis
Pre-test and Post-test results were taken and compared by employing ‘t’ test at 0.05 level of confidence.

From Table -1 it was observed that post-test result was less than pre-test result in case of trait anxiety and state anxiety. It indicated that trait anxiety and state anxiety became lesser due to yogic practices.

DISCUSSION OF THE FINDINGS

Burton (1979) stated that state anxiety describes the experience of unpleasant feelings when confronted with specific situations, demands or a particular object or event. It arises when the person makes a mental assessment of some type of threat. When the object or situation that is perceived as threatening goes away, the person no longer experiences anxiety. Thus, state anxiety refers to a temporary condition in response.

Wankel (1977) described that trait anxiety arises in response to a perceived threat, but it differs in its intensity, duration and the range of situations in which it occurs. People with a high level of trait anxiety experience more intense degrees of state anxiety to specific situations than most people do and experience anxiety toward a broader range of situations or objects than most people. Thus, trait anxiety describes a personality characteristic rather than a temporary feeling.

The obtained data on the subjects through application of statistical technique revealed that trait anxiety and state anxiety become lesser through practice of yogic exercises.

CONCLUSION

Mathur (1983) indicated that anxiety is considered as a block to an activity. A person who suffers from anxiety may not be able to devote his full energy during performing any task. From the above findings, it can be concluded that yogic exercises helps to minimize both the state anxiety and trait anxiety in a certain level. During teaching as well as coaching, teacher and coaches should keep in mind about such psychological facts which help the students and athletes for better educational achievement as well as sports performances.
