ABSTRACT
Herbal medicines as the major remedy and traditional system of medicine have been used in medical practices since antiquity. The phytochemical analysis of the medicinal plants are important and have great interest in both research institutes and pharmaceutical companies for the production of new drugs for curing of various diseases. The present study was aimed to investigate the presence of various phytochemicals from the ethanolic and aqueous extracts of leaf, stem bark, flower, root and seeds of *Syzygium cumini*. Five parts viz. leaf, stem bark, flower, root and seeds extracts of *Syzygium cumini* were investigated for their phytochemicals and HPTLC analysis. The plant extract contains carbohydrates, proteins, alkaloids, flavonoids, tannins, steroids, tri-terpenoids, phenol and saponin. The present study provides evidence that the plant contains medicinally bioactive compounds & this justifies the use of the plant species as traditional medicine for treatment of diabetes. Additional work is encouraged to elucidate the possible mechanism of action of these extracts.

Introduction:
Diabetes mellitus is a global epidemic and one of the leading causes of morbidity and mortality. Additional medications that are novel, affordable and efficacious are needed to combat against this rampant disease. Medicinal plants have been used in primary health care over many centuries before the advent of modern medicine. Medicinal plants are the richest bio-resource of drugs of traditional systems of medicine, modern medicines, neuropeptidicals, food supplements, folk medicines, pharmaceutical intermediates and chemical entities for synthetic drugs (Ncube et al., 2008). *Syzygium cumini* (L.) is belonging to the family Myrtaceae (having perfume-Greek Myron =perfume). It is indigenous to India and Indonesia, but it naturalized in Thailand, the philippines and Madagascar and cultivated throughout Afrika & tropical America.

The plants are reported to contain vitamin C, gallic acid, ellagic acid, tannins, anthocyanins, includes cyanidan, petunidin, malvidin glucoside and other components (Martinez and Del, 1981, Wealth of India Raw materials 1976)\(^{1,2}\). Leaves of *Syzygium cumini* containing acylated flavonol, glycosides, essential oils\(^2\) (quercetin, myricetin, myricitrin, myricitrin 3-O-4-acetyl-L-rhamnopyranoside\(^4\), triterpenoids\(^5\), esterase, galloyl carboxylase and tannin. The stem bark is contain betulinic acid, friedelin, epi-friedelanol\(^6\), myricitin, myricetin 3-O-4-acetyl-L-rhamnopyranoside \(^7\), eugenol and fatty acid ester of epi-friedelanol\(^8\), berogensins, flavonoids and tannins\(^9\). The roots are rich in flavonoid glycosides and isorhamnetin 3-O-rutinoside\(^10\). Seed oil contains lauric, myristic, palmitic, steric, oleic, linoleic, malvac, sterculic and vernolic acid\(^11\).

The plants were pharmacologically proves to posses hypoglycaemic, antibacterial, anti-HIV activity and anti-diarrheal effects (Bhuian et al., 1996, Indira and Mohan, 1993 and Ravi et al., 2004)\(^{12,13,14,15}\). Leaves and barks of *Syzygium cumini* have anti-inflammatory activity (Muruganandan et al., 2001)\(^16\). The aqueous and methanolic extract of *Syzygium cumini* (seed) and shows α-amylase inhibition\(^17\). Leaves have been also used in traditional medicine as a remedy for diabetes mellitus in many countries (Rahman and Zaman 1989)\(^18\). The bark is acrid, sweet, digestitve, astringent to the bowels, anthelmintic and used for the treatment of sore throat, bronchitis, asthma, thirst, biliousness, dysentery and ulcers. It is also a good blood purifier. The fruit is acrid, sweet, cooling and astringent to the bowels and removes bad smell form mouth, biliousness, stomachic, astrangent, diuretic and antidiabetic\(^19\). Aquas suspension of seed kernel of *S.*cuminum showed hypoglycemic effect in normal rabbits and alloxan induced diabetes in rat. Seed powder showed hypoglycemic effect in strepto zotocin induced diabeties and lowered cholesterol free fatty acid and triglyceric level\(^20\).

The plant was used for long time in Indian tradition, but it wasn't studied to determine its chemical composition. The plants have complicated composition and the phytochemical studies can be performed using chromatographic and spectral methods that can separate and characterize the different compounds from complex matrix. Within a decade, there were a number of dramatic advances in analytical techniques including TLC, UV, NMR and GC-MS that were powerful tools for separation, identification and structure determination of Phytochemical. The present study deals with phytochemical investigations and TLC identification analysis of leaf, stem bark, seed flower and root of *Syzygium cumini* (L.)

Research Elaboration:
Plant material
Fresh the plant specimens (leaves, root, seed, flower and stem bark) of *Syzygium cumini* (L.) were collected from herbal garden of Arogyadham campus, Deendayal research Institute Chitrakoot, Satna, MP, India and authenticated by taxonomist. A voucher specimen no. 102 is kept at herbarium in Institute Chitrakoot, Satna, MP, India and authenticated by taxonomist. A voucher specimen no. 102 is kept at herbarium in University campus, Chitrakoot for further reference. The All chemicals and reagents used including the solvents were of analytical grade.

Preparation of extracts
All the plant specimens were washed thoroughly with normal tap water followed by sterile distill water and air dried at room temperature for one week to get consistent weight. The dried samples were crushed to powder using grinder. Powder were stored in air tight container bottle 10 gm of each sample were extracted with 100 ml of methanol and water for using soxlet extraction.

The mixtures were evaporating under reduced pressure using rotory vaccum evaporator (Buchi type). And stored in refrigerator. The condensed extracts were used for preliminary screening of phytochemicals.

Preliminary Phytochemical Screening
The phytochemical tests of the ethanol and water extracts of *Syzygium cumini* (L.) were carried out to identify various
phytocosstituents using with standard procedures for determining the presence and/or absence of phytochemicals.

Quantitative Analysis of phytochemicals

Determination of total polyphenol

The concentration of phenolics in methanol fraction of *Syzygium cumini* (L.) was determined with the Folin–Ciocalteu’s reagent (FCR) using spectrophotometric method. Each sample (1 ml) was mixed with 0.5mL FCR (diluted 1:10, v/v) followed by 2 ml of sodium carbonate (20.00%, v/v) solution. A set of standard solutions of gallic acid (20, 40, 60, 80, and 100 ug/ml) were prepared. The absorbance was measured at 660 nm for test and standard solutions against the reagent blank at 765nm after incubation at room temperature for 90 min. Results were expressed as mg of GAE/gm of extract.

Determination of total proteins: Extraction of Protein from sample

Extraction is carried out with buffers used for the enzyme assay. Accurately weighed 500 mg of the sample were ground well with a pistle and mortar in 5-10 ml of the buffer. Centrifuged (SORVALL RC 5B plus) 20 minutes at 10,000 rpm and collected supernatant used for protein estimation.

Standard Protein solution

Weighed accurately 50 mg of bovine serum albumin (fraction V) and dissolved in distilled water and the volume was made up to 50 ml in a standard flask. Diluted 10 ml of the stock solution to 50 ml with distill water in a standard flask. 1 ml of this solution contains 200 µg protein.

Estimation of protein

Piperidine 0.2, 0.4, 0.6, 0.8 and 1 ml of the working standard into a series of test tubes and 0.1 ml and 0.2 ml of the sample extract in two other test tubes. The volume was made to 1ml in all the test tubes. A tube with 1 ml of water serves as the blank. Added 5 ml of Alkaline copper solution to each tube including the blank. Mixed well and allowed standing for 10 minutes. Then added 0.5 ml of freshly prepared Folin-Ciocalteau reagent mixed well and incubated at room temperature. Kept in the dark for 30 min. A blue color is developed. The absorbance was measured at 660 nm by UV spectrophotometer and calculated the amount protein in the sample. By plotting a standard graph and expressed the amount of protein in mg/gm of sample.

Determination of Total Saponin:

Determination of total saponin was done using anisald hyde reagent. Sample solution was prepared in water. For total saponin estimation 500 μl of sample, 500 μl of 0.5% anisaldehyde reagent were mixed and kept aside for 10 min. Later, 2 ml of 50% sulphuric acid reagent was added and tubes were mixed. Tubes were then kept in water bath with constant temperature of 60 °C. After 10 min tubes were cooled and absorbance was taken at 435 nm by UV spectrophotometer. The amount of saponin was calculated as saponin equivalent from the calibration curve of standard saponin (100-1000 ug/ml).

Determination of alkaloids:

Calibration curve

The calibration curve was obtained with bismuth nitrate pentahydrate stock solution. Series dilutions of the stock solution were made by pipetting out 1, 2, 3, 4, 5, 6, 7, 8 and 9 ml of stock solution into separate 10ml standard flask and diluting to volume with distilled water. A 1ml amount of this solution was taken and 5ml thiourea solution was added to it the absorbance value of the yellow solution was measured at 435 nm against colorless reagent blanks.

Assay for alkaloids

A 5 ml amount of the extract/solution was taken and the pH was maintained at 2-2.5 with dilute HCL. A 2 ml amount of Dragendorff’s Reagent was added to it, and the precipitate formed was centrifuged. The centrifuged was checked for complete precipitation by adding DR. after centrifugation the centrifuge was decanted completely and meticulously. The precipitate was further washed with alcohol. The titrate was discarded and the residue was then treated with 2ml disodium sulfide solution. The brownish black precipitate formed was then centrifuged. Completion of precipitation was checked by adding 2 drops of disodium sulfide. The residue was dissolved in 2mlconcentrate nitric acid with warming if necessary this solution was diluted to 10 ml in a standard flask with distilled water 1ml was then pipetted out and 5 ml thiourea solution was added to it, the absorbance was measured at 435 nm against the blank containing nitric acid and thiourea. The amount of bismuth present in the solution was calculated using calibration curve. The amount of bismuth corresponds to the amount of alkaloids present.

High performance thin layer chromatography:

The methanolic extracts of the samples T1 (leaf) T2 (seed) and T3 (stem bark) T4 (standard marker) T5 (flower) T6 (root) of *Syzygium cumini* (L.) were subjected to HPTLC fingerprint profile to check the presence of different phytoconstituents. HPTLC Fingerprinting was carried out on precoated silica gel HPTLC aluminium plates 60F254 (10 cmx10 cm, 0.2mm thickness, 5-6 μm particle size, E-Merck, Germany) by using CAMAG HPTLC System (Switzerland). 4 μL and 6 μL of each of the extract were spotted as bands of 8 mm width by using a LINOMAT 5 Sample Applicator fitted with a 100 μL Hamilton Syringe. The plates were developed using Tolune: ethyl acetate (7:3) as a mobile phase in CAMAG twin-trough chamber lined with filter paper and pre-saturated with 10 ml mobile phase. The resulted plates were dried in air and photo documentation was done at ultraviolet light at 254nm, 365nm and day light using CAMAG REPROSTAR 3 equipped with WINCATS Software. Numbers of bands, color of separated compound and Rf values were recorded.

Result and Discussion:

In present study the leaves, stem bark, seed and root of *Syzygium cumini* (L.) Linn were evaluated for its phytochemical aspects.

The results of preliminary phytochemical screening in the methanolic and water extracts of the drugs showed the presence of carbohydrates, flavonoids, alkaloids, resin, saponins and tannins, results were summarized in Table-1. The various phytochemical compounds detected are known to have beneficial importance in medicinal sciences. For instance, Alkaloids have been associated with medicinal uses for centuries and one of their common biological properties is their cytotoxicity.

The quantitative analysis of phenolic contents, protein, saponin and alkaloid were carried out using spectrophotometer and results are given in Table-2. The total phenolic contents in the examined plant extracts is expressed in terms of gallic acid equivalent (the standard curve equation: Y=1.77186x*0.07036, r2=0.99989). The concentration of total phenols was measured 2.586, 6.4525, 1.9837, 1.2341, 1.495 ug/ml for leaf, stem bark, seed, flower and root respectively. The protein contents in the examined plant extracts is expressed in terms of BSA equivalent (the standard curve equation: Y=0.05346x + 0.1614, r2=0.99843).The concentration of protein was measured 2.196, 3.5166, 2.389, 2.3562, 1.697 ug/ml for leaf, stem bark, flower and root, seed, flower respectively. The Saponins contents is expressed in terms of Saponins equivalent (the
standard curve equation: \[ Y = 0.07150x + 0.01277, \] \[ r^2 = 0.97804. \] The concentration of Saponins was found 0.339, 0.283, 0.282, 0.435 and 0.250 \( \mu \)g/ml for leaf, stem bark, seed flower and root respectively. Similarly the alkaloid contents is expressed in terms of mg of Bismuth nitrate/g of extract equivalent (the standard curve equation: \[ Y = 0.99892x + 0.19872, \] \[ r^2 = 0.99693. \] The concentration of alkaloids was found 0.174, 0.236, 0.319, 0.318, 0.457 \( \mu \)g/ml for leaf, stem bark and seed, flower, root respectively.

The results from HPTLC Fingerprint observed under ultraviolet region at 366nm and after derivatization with 5\% methanolic \( H_2 SO_4 \). The color of the band resolved and their \( R_f \) values were tabulated in Table-3.

A simple qualitative HPTLC analysis was performed and \( R_f \) values were recorded. HPTLC Plate shows one bands at 366 Rf 0.91 for test sample T1 contains one bands at Rf, 0.91, T2 observed eight spot at Rf 0.6, 0.10 (red), 0.24 (red), 0.54 (blue), 0.62 (red), 0.66 (red) 0.83,0.91 (red). In test sample T3 observed seven spot 0.6 (red), 0.91 (red), 0.91 and T4 observed five spot \( R_f \) value 0.8 red, 0.34, golden yellow, 0.38 blue 0.61 blue, 0.79, sky blue). T5 observed six spots 0.6 red, 0.79 blue, 0.91 red, 0.91 (red) and T6 observed five spots 0.91 (red), 0.57, 0.6 red (red), 0.79 (red) and 0.91 (red). After derivatization with 5\% methanolic \( H_2 SO_4 \) the spots of T1 0.91, T2 0.10 (pink), 0.57 (greenish yellow)., 0.84 (pink), 0.91 (red), T3 0.57 (green yellowish), 0.91, T4 0.8 (red), 0.33 (green), 0.57 (green), 0.78 (green), 0.91 (red), T5 0.57 (green), 0.91 (red), 0.33 (green), 0.57 (green), 0.78 (green), 0.91 (red), day light have one spot 0.57 and T6 0.91 (red), 0.57, 0.57 (green), 0.91 (red), 0.57 were resolved under 366 nm. We observed eight spot at \( R_f \) 0.6,0.10 (red), 0.24 (red), 0.54 (blue), 0.62 (red), 0.66 (red) 0.83,0.91 (red). The color of the band resolved and \( R_f \) values were tabulated in Table-3.

Flavanoids

Current findings ascertain the claimed medicinal or therapeutic effects of plants secondary metabolites and pigments that can have therapeutic actions in humans and which can be refined to produce drugs.
