ABSTRACT

22 March Janta Carfew.23rd March The lockdown begins at 5:00 p.m. The school-college holiday started a week before that. Where the joy of a sudden vacation did not happen. When we find out that the holidays are very careful with all the government restrictions we have to live life more strictly now. Government instructions must be obeyed, hands must be clean, especially oneself, and so on and so forth. But the answer is why don't do what came from where and how it changed our lives. This change is a completely different change that no human has ever seen before. I have changed a lot in one fell swoop. I don't fully understand how much I have changed. When I see Kolkata empty on TV, it seems as if hundreds of people like me are looking for this familiar city. Until a day ago, this well-known city was full of people. Everything seemed to come to a standstill in one fell swoop. The education system has become completely dependent on online during the epidemic. And in doing so, both teachers and students have adopted the method of learning through online learning. It is undeniable that online education has taken a massive shape in the field of education.

INTRODUCTION

This change is a completely different change that no human has ever seen before. Corona is a completely new word that none of us know. LOCKDOWN before the start, all school-college educational institutions began to close slowly. The school-college hall was almost closed a week before the Twenty-Third March Janta crowd called to him, and that was from the previous Monday.. Holidays that are full of complexity are neither fun nor comfortable. We used to pray for holidays at different times due to work pressure but today what a strange unexpected holiday came to life. Somewhere as if the city was screaming and looking for a place where hundreds of people like me had gone. It's like the whole country, the whole city and the whole world is silent. Today we are housebound for our own health. This prisoner is not for the minQuantitative research is a research strategy that focuses on quantifying the collection and analysis of data. It is formed from a deductive approach where emphasis is placed on the testing of theory, shaped by empiricist and positivist philosophies. A depiction of data networks and big data. Associated with the natural, applied, formal, and social sciences this research strategy promotes the objective empirical investigation of observable phenomena to test and understand relationships. This is done through a range of quantifying methods and techniques, reflecting on its broad utilization as a research strategy across differing academic disciplines.

who are working tirelessly to make our lives healthier by keeping them safe in our homes. Somewhere we have found God in them. How they are saving our lives in this danger. A huge battle. Vaccine news is available every day. When will that vaccine succeed? Mankind is waiting for the vaccine to succeed. Radical changes took place according to the social system. It started with Max having to wear gloves in the face of social distance. A new method in the field of education system is called E learning process. This learning process has been taken forward through various platforms so that students can take the study forward at home. Nature has become thousands of beautiful. In a pollution-free nature, birds and animals are all free today, only people are house captives today.

Two thousand and twenty years later, when 2021 comes, it is widely believed that education may be possible offline, but in reality it has not yet been completed. Because the epidemic is not over yet, people may be vaccinated in 2021, but in schools and colleges, it is becoming increasingly difficult to teach offline. Every effort is being made to bring the whole education system online or to the whole classroom in front of the students and to teach them in the right way through the right teaching method. Online Education We may be very new

to this method but we have to master it because if the education system was completely stopped by the epidemic it would not be good for the next generation. It would not be good for our world. Has been helping us a lot.

A variety of apps are being used on a daily basis to make the whole of school life available to the students online and the students are getting excited but in many cases it is seen that the students may not have the appropriate technology to learn online but there may be some problems. In that case too, there is a lot, but it has been possible to reach the students through online education We are all waiting for the time when our school will reopen as before. The educational institutions will reopen as before. We will be able to study in a normal and beautiful way again. But as long as it is possible, we will have to learn online As we learn, we need to pay special attention to how we can take future generations further.

Life without education is never possible, so education is a part of life, so how can this education awaken the inner self in the students? Creativity has also been provided so that students can express themselves so that they can do whatever they want through poetry, dance, song and whatever they want. Educational online is also provided.

Students are participating in curriculum activities with different types of dance-song poetry drawing pictures through online education so that they can try to present the school co-curricular ones gradually through online. In the case of normal life, I used to do it in educational institutions but students are getting education through online.

REVIEW OF LITRETUTR

Clinical presentation of covid-19 The infection caused by the virus SARS- COV-2 is termed as coronavirus disease 2019(COVID-19). The the symptomatology of covid-19 was extensively discussed in WHO China joint report on covid-19 (n=55,924). Patient with covid-19 presently pyrexia in 85% of case during their cause but only 45% are febrile on early presentation. Moreover cough is seen in 60 7.7 % of patient and sputum in produced in 33.4 % . Respiratory symptoms such a dyspnea, short throat, and nasal congestion patient in 18.6% 13.9% and 4.8% of cases. Respectively constitutional. Symptoms such as muscle or bone aches, chills and hate ache are seen in 14.8% 11.4% and 13.6% of the cases restrictively. Gastrointestinal (GI) symptoms such as nausea or vomiting and diarrhoea are seen in 5% and 3.7 % of the cases respectively. These clinical manifestation of covid-19 we're consistent in other similar studies on covid-19 patient in China(n=41, n=81, n=99, n=138). More Severe insult on the long tissue can result in acute respiratory distress

syndrome (ARDS) which can further precipitate septic shock. These to complication are the major contributors to intensive Care unit (ICU) care and mortality from covid-19 inpatient older than 60 years with smoking history and comorbid medical conditions. Smoking and older age group patient tend to have a higher density of ACE2 receptors. OUR OVERALL ANALYSIS (N=1458) show that the leading comorbid condition include hypertension cardiovascular and cerebrovascular disease and diabetes.

METHODOLOGY

Quantity methods in faces objective measurement and the statistical mathematical on numerical analysis of data collect for polls questionnaire and surveys, or by manipulating pre existing statistical data using computerization technique. quantitative research focused on gathering numerical data and generalisation in a closed group of people are the explain a particula phenomenon.

Quantitative research is a research strategy that focuses on quantifying the collection and analysis of data. It is formed from a deductive approach where emphasis is placed on the testing of theory, shaped by empiricist and positivist philosophies. A depiction of data networks and big data. Associated with the natural, applied, formal, and social sciences this research strategy promotes the objective empirical investigation of observable phenomena to test and understand relationships. This is done through a range of quantifying methods and techniques, reflecting on its broad utilization as a research strategy across differing academic disciplines. The objective of quantitative research is to develop and employ mathematical models, theories, and hypotheses pertaining to phenomena. The process of measurement is central to quantitative research because it provides the fundamental connection between empirical observation and mathematical expression of quantitative relationships. Quantitative data is any data that is in numerical form such as statistics, percentages, etc. The researcher analyses the data with the help of statistics and hopes the numbers will yield an unbiased result that can be generalized to some larger population. Qualitative research, on the other hand, inquires deeply into specific experiences, with the intention of describing and exploring meaning through text, narrative, or visual-based data, by developing themes exclusive to that set of participants. Quantitative research is widely used in psychology, economics, demography, sociology, marketing, community health, health & human development, gender studies, and political science; and less frequently in anthropology and history. Research in mathematical sciences, such as physics, is also "quantitative" by definition, though this use of the term differs in context. In the social sciences, the term relates to empirical methods originating in both philosophical positivism and the history of statistics, in contrast with qualitative research methods. Qualitative research produces information only on the particular cases studied, and any more general conclusions are only hypotheses. Quantitative methods can be used to verify which of such hypotheses are true. A comprehensive analysis of 1274 articles published in the top two American sociology journals between 1935 and 2005 found that roughly two thirds of these articles used quantitative method.

RESULT AND DISCUSSION

Do not do it anymore and the only vaccine from this horrible situation is the way to our success or liberation We are waiting every moment when the vaccine will be discovered. Until the vaccine comes on the market, we have to live by all these precautions and government guidelines. Don't be such a terrible man-borne disease that every man has to stay away from other people. We are still alive today, maintaining this distance by wishing every human being well.

We can say that online education has made it almost possible

for students to develop their physical, social, aesthetic and physical aspects through online education. Students can also participate in their education system in many ways. They can use different apps. They can learn different ways of learning through these apps. They can move forward in life.

CONCLUSION

Don't make me understand that we are all human beings and nothing else. We waited when will the free world that beautiful day come? There will be no obstacles, we will be free to roam in this beautiful world again, we will be able to enjoy. Until the vaccine is discovered, all of our government restrictions. We all have to move forward shoulder to shoulder in these few days while washing our hands, rubbing our hands, rubbing our glasses and maintaining social distance.
